Chapter 1. Introduction
1.1. General background ..... 1
1.1.1. Vocabulary acquisition research since the 1980s ..... 1
1.1.2. Importance of collocation studies and related problems ..... 2
1.1.3. Change of vocabulary treatment for Japanese learners of English in the government guidelines for foreign language teaching ..... 4
1.1.4. Lack of pedagogical consensus on collocation in Japan ..... 6
1.2. The main research questions and organization of the chapters ..... 7
Chapter 2. Literature review (1): Definition of collocation
2.1. Introduction ..... 9
2.2. Terminology of three major groups of phraseology ..... 9
2.2.1. Collocation, idiom and free combination ..... 10
2.2.2. Terminology problem ..... 25
2.3. Previous studies on collocations ..... 25
2.3.1. Descriptive studies ..... 25
2.3.2. Semantic studies ..... 41
2.3.3. Computational studies ..... 51
2.3.4. Lexicographic studies ..... 64
2.3.5. Pedagogical studies ..... 75
2.4. Importance of collocation ..... 85
2.5. Summary ..... 88
Chapter 3. Literature review (2): Empirical research on collocation
3.1. Introduction ..... 93
3.2. Empirical research on collocation to date ..... 93
3.2.1. Collocation research mainly in terms of L1 influence ..... 93
3.2.2. Collocation research in terms of several factors including L1 influence ..... 99
3.2.3. Other collocation research ..... 108
3.2.4. Summary ..... 111
3.3. State of collocation in Japan to date ..... 115
3.3.1. Collocation research in Japan ..... 115
3.3.2. Description of collocations in collocation dictionaries and English-Japanese dictionaries ..... 119
3.3.3. Summary ..... 122
Chapter 4. Pilot study
4.1. Introduction ..... 123
4.2. Definition of collocation in the present research ..... 123
4.3. Pilot Study I: Corpus-based research ..... 124
4.3.1. Pilot Study I-1: Same leveled six English I textbooks ..... 125
4.3.2. Pilot Study I-2: English I textbooks vs. English II textbooks ..... 128
4.3.3. Pilot Study I-3: Revised English I textbooks vs. former English I textbooks ..... 130
4.3.4. Pilot Study I-4: History textbooks in the UK ..... 133
4.3.5. Summary of the four pilot studies ..... 137
4.3.6. New research questions raised by the four pilot studies ..... 139
4.4. Pilot Study II: Empirical research ..... 141
4.4.1. Pilot Study II-1 ..... 142
4.4.2. New research question raised by Pilot Study II ..... 147
Chapter 5. Methodology: Phase I. Corpus-based research
5.1. Introduction ..... 150
5.2. Purpose and research questions ..... 150
5.3. Materials: Corpus ..... 152
5.3.1. British National Corpus (BNC) ..... 152
5.3.2. Making the TIME corpus ..... 154
5.3.3. Making the English I textbook corpus ..... 155
5.4. Selection of collocations ..... 156
5.5. Procedure ..... 159
Chapter 6. Results and discussion: Phase I. Corpus-based research6.1. Introduction161
6.2. Results ..... 161
6.2.1. Analysis of the BNC. ..... 161
6.2.2. Analysis of the TIME corpus ..... 164
6.2.3. Features of collocations in the BNC and the TIME corpus ..... 167
6.2.4. Are high-frequency collocations topic-oriented? ..... 169
6.2.5. Do collocations occurring in English textbooks for upper secondary school students in Japan deviate from those of native-speaker English? ..... 170
6.2.6. Summary ..... 176
6.3. Discussion ..... 178
6.4. Basic collocations determined by analyses of corpora ..... 183
Chapter 7. Methodology: Phase II. Empirical research on the development of learners' collocational knowledge
7.1. Introduction ..... 186
7.2. Research questions ..... 186
7.3. Selected collocations ..... 187
7.4. Materials ..... 191
7.4.1. Test A: Vocabulary size test ..... 191
7.4.2. Test B: Productive collocation test ..... 193
7.4.3. Test C: Receptive collocation test ..... 194
7.5. Subjects ..... 194
7.6. Data collection procedure ..... 195
7.7. Scoring procedure ..... 196
Chapter 8. Results and discussion: Phase II. Empirical research on the development of learners' collocational knowledge
8.1. Introduction ..... 199
8.2. Results ..... 199
8.2.1. Research question 1 ..... 199
8.2.2. Research question 2 ..... 205
8.2.3. Research question 3 ..... 208
8.2.4. Research question 4. ..... 212
8.2.5. Extra finding ..... 219
8.3. Discussion ..... 221
8.3.1. Discussion of research questions ..... 221
8.3.1.1. Research question 1 ..... 221
8.3.1.2. Research question 2 ..... 223
8.3.1.3. Research question 3 ..... 226
8.3.1.4. Research question 4 and extra findings ..... 228
8.3.3. Discussion of ease or difficulty of collocation acquisition in reception and production in the different vocabulary groups ..... 233
8.3.4. Summary of the collocation acquisition in the different vocabulary level groups ..... 243
8.3.5. Pedagogical implications ..... 245
Chapter 9. Conclusions
9.1. Overview ..... 250
9.2. Pedagogical implications for effective compilation of English textbooks ..... 254
9.3. Limitations of the study ..... 256
9.4. Future research ..... 258

## Acknowledgements

This doctoral dissertation would not have been completed without considerable help and encouragement of many special persons. First of all, I would like to express my greatest gratitude to my supervisor, Professor YANO Yasukata. His invaluable advice and thoughtful encouragement throughout the years made it possible to pursue critical reading of previous pieces of research and the originality of my dissertation. It has been my honor to complete it under his continuous instruction.

I would also like to express my deep appreciation to my dissertation committee members: Emeritus Professor SHINODA Yoshiaki, Professor Paul Snowden, Professor NAKANO Michiko and Professor MURATA Kumiko. Their constructive and critical comment on the draft of this dissertation helped me to polish it to the level of doctoral dissertation.

I would like to extend my great appreciation to Professor KAWAGUCHI Yoshikazu and Associate Professor NAMAI Kenichi, who helped to collect data for my research. I also wish to thank Professor Jeffrey Miller for reading through my manuscript patiently within a limited time. My special thanks are due to the late Emeritus Professor TANABE Yoji who proofread the abstract of this dissertation and gave me appropriate advice.

I am particularly grateful to my parents for their deep understanding and warm-hearted encouragement for years. They have always supported my pursuit of academic interests.

Finally, I owe a sincere gratitude to my husband, SHIMOYAMA Yukinari. He always gave me inspiring comments on my research and encouraged me to continue writing my manuscript wholeheartedly. Without his support and patience, I could not have completed this dissertation.

## Chapter 1. Introduction

### 1.1. General background

### 1.1.1. Vocabulary acquisition research since the 1980 s

Vocabulary acquisition has become a major focus of interest in EFL since the 1980s, for two main reasons. One reason is connected with the trend for pragmatics, which is the study of the use of language in communication, to become a major field of study in linguistics, and in ESL and EFL. The study of language is often divided into that of language structure and language use. To study language structure is to examine the function of a linguistic item as an element of the linguistic system, while to study language use is to analyze how it functions in communication and how effectively and appropriately people use a language in a certain context. Since the 1970s the latter has been researched in linguistics and language teaching, because the main function of language has been widely considered as a means of communication. As the importance of function of communication, that is, pragmatic competence, combined with psycholinguistics, was asserted by many linguists, it has come to be viewed as an essential part of learners' competence. As a result, the approach to communicative competence and the mental process of communication has been emphasized, and vocabulary, which is closely connected with pragmatic competence, has been focused on. This claim has been made by many researchers (Krashen, 1989; Carter, 1987; Widdowson, 1993) and proposals and plans for a lexical syllabus based on a communicative approach have also been made by Willis (1990) and Lewis (1993).

The other reason for highlighting vocabulary acquisition is connected with the spread of corpora, which are computerized and organized as large scale text for a certain purpose. As a result, many words and phrases have been investigated easily and objectively via computers. One of the most famous computerized databases is the British National Corpus (BNC), which is a sample of some 100 million words of present-day spoken and written British English. It is made up of 4,124 different text files, each containing either a complete text or a number of short related texts, or a substantial sample of a long text, and it gives researchers and material writers access to powerful tools for vocabulary analysis. Good examples based on the BNC are English dictionaries such as Oxford Advanced Learners' Dictionary (OALD), Longman Dictionary of Contemporary English (LDOCE) and Harrap's Essential English Dictionary (Harrap). Such scientifically accurate dictionaries reflecting the frequency of real examples by native speakers of English are easily obtained with the spread of computer systems and the use of more easily available corpus.

As mentioned here, vocabulary research has been a mainstream topic since the 1980s, supported by a focus on pragmatic competence and the spread of corpora.

### 1.1.2. Importance of collocation studies and related problems

In the study of vocabulary treated as a mainstream topic from the standpoint of language use rather than language structure, many linguists have focused not on each word in a sentence, but on the combination of words in terms of productivity. Therefore, collocation has become one
particular area of vocabulary research which has attracted their attention theoretically and practically. Benson, Benson and Ilson (1997) highlight the importance of this as follows:

> Learners of English as a foreign or second language, like learners of any language, have traditionally devoted themselves to mastering words their pronunciation, forms and meanings. However, if they wish to acquire active mastery of English, that is, if they wish to be able to express themselves fluently and accurately in speech and writing, they must learn to cope with the combination of words into phrases, sentences and texts. (p. ix)

Not only Benson et al. but also other researchers (Bahns \& Eldaw, 1993; Bahns, 1993; Channell, 1981; Lewis, 1993; Takizawa, 1999; Willis, 1990) have discussed the importance of collocation, and they agree that learners must master how words combine or collocate with each other in order to develop their vocabulary proficiency.

In spite of the agreement on this view of collocation, Mackin (1978) is rather dubious about the possibility of actually teaching collocations. He argues that ESL or EFL learners can not learn all the many thousands of collocations. The difficulty of collocational acquisition has been also claimed by Rudzaka, Channell, Putseys and Ostyn (1981) and Allerton (1984). This view point arises from the ESL or EFL learners' lack of collocational competence (Bahns, 1993) or intuition, which is defined as one basis for native speakers' establishing or confirming rules of the grammar and the usage of the language (Crystal, 1992). In order to specify the difficulty of collocational acquisition, many linguists have conducted challenging empirical research on the collocational mechanism for both native speakers of English and non-native speakers of English (Bahns, 1993; Bahns \&

Eldaw, 1993; Biskup, 1992; Caroli, 1998; Elyildirm, 1997; Ghadessy, 1989; Gitsaki, 1999; Granger, 1998; Greenbaum, 1970; Howarth, 1993, 1998a, 1998b)

Moreover, up until now, studies on collocation have been insufficient in defining the concept of collocation in a more rigorous way (Cowan, 1989). The well-known statement "the tendency of a lexical item to co-occur with one or more other words" is made by Backlund (1973, 1976), Cruse (1986), Crystal (1985), Halliday (1966), McIntosh and Strevens (1964), Ridout and Waldo-Clarke (1970), and Seaton (1982), and it has been followed since the definition of collocations was first introduced by Firth (1957) to more recent and up-to-date research projects by many linguists. However, none of them clearly mention the boundary between three phraseological concepts: free combination, idiom and collocation because they can be presented along a continuum (see section 2.2.1). The unclear concept of collocation results in various names for it (see section 2.2.2). Therefore, further collocation research and discussion are certainly required in order to clarify the concept of collocation and formulate a comprehensive theory of collocations.

### 1.1.3. Change of vocabulary treatment for Japanese learners of English in the government guidelines for foreign language teaching

While the importance of vocabulary acquisition and collocation acquisition are being reconsidered of late, they have been disregarded in Japan. The change of vocabulary treatment for Japanese learners of English is clearly reflected in the government guidelines for foreign language teaching published by the Ministry of Education, Culture, Sports, Science
and Technology (MEXT).

Table 1. Decreases of the number of words in the government guidelines for foreign language teaching published by MEXT

|  | lower secondary school | upper secondary school |  |
| :---: | :---: | :---: | :---: |
| implementation | No. of words | No. of words | total |
| $1960(1962)$ | $1100 \sim 1300$ | 3600 | $4700 \sim 4900$ |
| $1973(1972)$ | $950 \sim 1100$ | $2400 \sim 3600$ | $3350 \sim 4700$ |
| $1982(1981)$ | $900 \sim 1050$ | $1400 \sim 1900$ | $2300 \sim 2950$ |
| $1992(1993)$ | $\sim 1000$ | maximum 900 | 1900 |
| $2003(2002)$ | $\sim 900$ | maximum 900 | 1800 |

$(\quad)=$ the year when the government guidelines for foreign language teaching for lower secondary school students were implemented.

Table 1 shows the change of word-number taught to students at lower and upper secondary schools. It was found that the number of words included in each textbook has steadily decreased to date. In 2003 textbooks, up to 900 words should be taught at lower secondary schools and up to 1800 words at upper secondary schools. In fact, the way to count words is word form, that is, word stem and the inflection should be counted separately. For example, sleep and slept are two words according to the counting method adopted by MEXT. This means that with 900 words taught at lower secondary school learners face difficulty expressing themselves. Moreover, these 900 words contain function words such as prepositions and pronouns, so that expressions with those words are even more limited.

The number of words required to communicate properly is different according to different researchers. Laufer $(1997,1992)$ claims that at least 3000 words are needed to read academic texts, which is supported by Tono (2003) as the vocabulary size Japanese learners of English should aim at, although he mentions that 2000 words are requisite to read $80 \%$ of an easy
text. According to Chujo \& Takefuta (1994), 5000-7000 words are necessary to communicate without any trouble. Nation (2001) maintains that to reach $95 \%$ coverage of academic texts, about 4000 word families should be acquired, consisting of 2000 high-frequency general service words, about 570 general academic words and about 1000 technical words, proper nouns and low-frequency words. Compared with those arguments by some linguists, 1800 words learned by the $12^{\text {th }}$ is insufficient in communication.

Thus, the number of words aimed at for Japanese learners of English seems to be quite limited, so that there is a great possibility that they face difficulty communicating with their acquired words.

### 1.1.4. Lack of pedagogical consensus on collocation in Japan

The description of collocation in the government guidelines for foreign language teaching shows an unclear concept of collocation.
(3) Language elements
B....Basic collocations should be chosen for instruction
(From the description of collocation for upper secondary school students in the government guidelines for foreign language teaching in Japan (2003))

This is a rather vague description, which does not explain which collocations are basic and how many collocations should be selected. This means that those who compile textbooks for Japanese learners of English and English teachers at secondary schools have no general concept and consensus on collocation, and have to adopt an arbitrary choice of collocations. Furthermore, the government guidelines for foreign language teaching in

1960 and 1973 recommended that high-frequency collocations be taught and presented with some examples to be acquired by secondary school students and mentioned be able to and have to as collocations. However, whether be able to and have to are collocations or not and whether these examples are really high-frequency words or not are questionable. In fact, collocations have been called by various names such as jukugo, kanyoku, kogohyogen, rengo and so on, and idioms, collocations, and phrasal verbs have been all covered by these expressions. This is because there has been little pedagogical research on collocation in Japan, compared with other collocation studies to date. This is a matter to be solved in Japan as soon as possible.

### 1.2. The main research questions and organization of the chapters

Judging from the present state of collocation study in Japan, it would be meaningful to conduct an empirical study on collocations of Japanese learners of English. Broad questions arise as follows:

1. What is collocation?
2. What are basic collocations needed to be acquired for Japanese learners of English?
3. How are the collocations to be acquired by Japanese learners of English?
4. What is effective teaching of collocations?

This paper consists of the following chapters. In Chapter 2, collocation is compared with free combinations and idioms; the study of collocation to date
is reviewed in terms of five study fields; and the importance of collocation study is clarified in order to define collocation. In Chapter 3, the empirical research on collocation to date and the research on collocation in Japan to date are introduced. In Chapter 4, a definition of collocation in this research is given, based on previous theoretical and practical research on collocations in Chapters 2 and 3, and research questions are posed, following some pilot studies. In Chapters 5 and 6, in order to identify basic collocations for Japanese learners of English, corpus-based research is undertaken and the results are discussed. In Chapters 7 and 8, in order to clarify the mechanism of collocation acquisition by Japanese learners of English, empirical research is conducted and the results are discussed with the presentation of the findings. In Chapter 9, summary of all the previous chapters; pedagogical implication for the effective compilation of English textbooks; limitations of this study; and proposals for future research are mentioned as the conclusion.

## Chapter 2.

## Literature review (1): Definition of collocation

### 2.1. Introduction

This chapter briefly reviews the early studies of collocation, which are of particular relevance to the present study. The first section examines some linguists' perspectives on the distinction between three main phraseological combinations-idioms, collocations, and free combinations-and the criteria to differentiate them. Also, inconsistent names for two main criteria for collocation are clarified. The second section gives an explanation of the definition and features of collocation in five different research groups: descriptive studies, semantic studies, computational studies, lexicographic studies, and pedagogical studies. The final section concisely describes the importance of collocation.

### 2.2. Terminology of three major groups of phraseology

According to Gitsaki (1999), many linguists state that semantic transparency appears to be the only criterion that could make a difference between idioms and collocations. However, considering three main phraseological combinations-idioms, collocations, and free combinationsnot only semantic transparency but also collocational restriction is also regarded as an important criterion by many linguists (Aisenstadt, 1979; Benson, Benson \& Ilson, 1986; Carter, 1987; Cowan, 1989; Cowie \& Howarth, 1996; Cruse, 1986; Fernando, 1996; Gramley \& Pätzold, 1992; Korosadowicz-Struzynska, 1980). Furthermore, some of the linguists who agree to these two criteria to distinguish between idioms, collocations, and
free combinations add one or two more criteria to differentiate these three combinations more clearly, while they admit that those criteria tend to be expressed along a continuum and the boundary between the three categories cannot be clearly set.

### 2.2.1. Collocation, idiom and free combination

Aisenstadt (1979, 1981) first regards collocability restrictions as a distinctive and important part of the wide field of collocability, and defines them as certain commutability restrictions, that is, their ability to combine with other words. In terms of the collocability restrictions, he categorizes all English word combinations into idioms and non-idiomatic phrases, and the latter, which are the huge majority functioning in speech, can further be subdivided into free phrases and restricted collocations. Figure 1 expresses constituents of English word-combinations:

Figure 1. Categorization of English word combinations by Aisenstadt (1979, p. 71, 1981, pp. 53-54)

Restricted collocations are defined as "a type of word combination consisting of two or more words, unidiomatic in meaning, following certain structural patterns, restricted in commutability not only by semantics, but also by usage, belonging to the sphere of collocations" (1981, p. 54).

Owing to those characteristics, they can be separated from idioms and free combinations. Restricted collocations and idioms are different in that
their constituents are either transparent or not. Aisenstadt describes it with an example of face the facts, face the truth, face the problem, face the circumstances, and face the music including the verb face (1979, p. 71). Face the music is an idiom, while the others are restricted collocations in terms of semantic units, that is, the meaning of each combination is composed from the sum of the meanings of its constituents. Face the music means expose oneself to a serious position where one will be criticized for something one has done and the general meaning of each constituent does not reflect the whole meaning at all. On the other hand, the meaning of each constituent of other combinations is clear. Thus, idioms have unique meanings, which are never reflected from the meaning of each constituent of the combinations and they do not have other patterns and other variable constituents, while restricted collocations have variability and usually occur in patterns with some interchangeable constituents.

On the other hand, Aisenstadt maintains that restricted collocations differ from free combinations by their commutability restrictions conditioned by usage. He cites an example of carry to differentiate the two combinations. When carry has the main meaning of supporting the weight of something or taking something from one place to another, it can collocate freely with any noun denoting what is supported or moved like in carry a book/bag/chair, which are free combinations. However, when carry has another meaning of convincing something or winning the argument as in carry conviction and carry weight, it is a constituent of restricted collocations, because the verb is connected with only a few possible variations of nouns.

As mentioned above, Aisenstadt (1979) claims that restricted collocations are different from idioms in commutability restrictions by grammatical and
semantic valence and from free combinations in commutability restrictions by usage.

Nattinger and DeCarrico (1992) and Carter (1987) set up three criteria to distinguish between idioms, collocations and free combinations. Nattinger and DeCarrico (1992, pp. 176-178) cites the definition of collocations by Wood (1981) as the best model for the definition of the word combinations. He considers them as a continuum with completely invariant clusters at one end, freely combining morphemes at the other end, all degrees of combinational flexibility in between. They admit semantic criterion of compositionality, which means the meaning of the combinations is predictable from each constituent. They propose one more parameter, productivity, which looks at whether the form of a combination is structurally unique.

Using these three parameters, flexibility, compositionality, and productivity, they attempt to define the continuum more precisely with idioms, collocations, colligations and free combinations, the third of which they originate. The continuum is shown as follows:

| idioms | collocations | colligations | free combinations |
| :---: | :---: | :---: | :---: |

Figure 2. Continuum of word combinations by Nattinger and DeCarrico (1992, p. 178)

Idioms are fully non-compositional and non-productive collocations, i.e. completely unpredictable in their meaning and form like in by and large and hell for leather. They are completely frozen expressions and there are relatively few, since most other phrases admit some degree of
compositionality or productivity. Free combinations, which are placed at the other end of the continuum, are fully compositional and productive collocations, i.e. completely predictable from each of their constituents like in see the river. In between these two extremes are various degrees where collocations and colligations are placed. Collocations are roughly compositional but are restricted to certain specified collocations. Kick the bucket is not completely frozen, because kick in the sense of die can be connected with off and out into kick off and kick out. However, it is less compositional than free combinations such as drink milk/tea/coffee. When substitution is limited by syntactic category and semantic feature, the combinations are called colligations like in off with his head.

Carter (1987) holds the same opinion as Nattinger and DeCarrico (1992) in regarding the same three criteria as important in determining how fixed particular lexical patterns are and they are a matter of degree, from unrestricted collocations to restricted collocations, from flexible to go-it-alone, from transparent to opaque. But instead of productivity he names the third criterion which determines whether the form of a combination is structurally unique syntactic structure.

Korosadowicz-Struzynska (1980) offers three criteria to distinguish between collocations and idioms, which are slightly different from those of Nattinger and DeCarrico (1992) and Carter (1987). He defines collocations as "situationally appropriate forms of language which are to a great extent institutionalized" and calls them conventional syntagmes (1980, p. 111). In order to distinguish between collocations and idioms, he proposes three criteria: semantic opacity, the impossibility of passivization, and peculiarity to a language. According to the first criterion, semantic opacity, idioms are
phrases whose meaning cannot be inferred from the meaning of their constituents or phrases used as words, while collocations are kinds of set expressions the meaning of which can be inferred if learners know the meaning of their constituent lexical items and if they have some background knowledge in certain specific cases. The second criterion, the impossibility of passivization is called fixity by Fernando (1996), commutability restriction by Aisenstadt (1979), productivity by Nattinger and DeCarrico (1992) and collocational restriction by Carter (1987). Based on it, idioms cannot be altered, no other synonymous word can be substituted for any word in an idiomatic phrase, and the arrangement of the words can rarely be modified. With collocations, most of them do not lack syntactic flexibility. The third criterion, peculiarity to a language, is Korosadowicz-Struzynska's original which is not listed as one of the criteria to identify idioms and collocations by other linguists and is clarified citing Lado (1955) as follows:

> Idioms - expressions peculiar to a language - are identifiable as we compare two languages rather than within the language itself. An expression which may seem peculiar to native speakers may be quite natural to speakers of another language and would therefore not be an idiom to them. On the other hand, an expression which seems quite natural to native speakers may be strange to foreign speakers of a particular language background. If we should find, on comparing the expression with a variety of languages, that it is strange to all or nearly all of them, we would be justified in calling it an idiom in general, but even then the statement would be meaningless in those cases in which the other language had a parallel expression. (cited in Korosadowicz-Struzynska, 1980, p. 287)

According to Lado's suggestion, idioms are natural to native speakers but peculiar to foreign speakers of a particular language background, whereas collocations seem to be shared by speakers of any languages.

In order to express the complexity and variation of collocations and idioms, Cowie and Howarth (1996) take into account these four criteria: familiar (or institutionalized), stored (or memorized), limited and arbitrary variable (restricted), and semantically opaque as included in optional criterion. The levels of collocational complexity are shown in Figure 3 (Cowie \& Howarth, 1996, p. 83, referred in Schmitt, 2000, p. 79)

## LEAST COMPLEXITY AND VARIATION

1. IDIOM
bite the dust, shoot the breeze
2. INVARIABLE COLLOCATION
break a journey, from head to foot

## 3. COLLOCATION WITH LIMITED CHOICE AT ONE POINT

take/have/be given precedence [over noun phrase] give/allow/permit access to [noun phrase] have/feel/experience a need [for noun phrase]

## 4. COLLOCATION WITH LIMITED CHOICE AT TWO POINTS

as dark/black as night/coal/ink
get/have/receive a lesson/tuition/instruction [in noun phrase]
MOST COMPLEXITY AND VARIATION
Figure 3. Levels of collocational complexity by Schmitt (2000, p. 79)

At the first level, idioms are multiword lexemes which never permit any variation and once one constituent of them is changed, they cease to exist as idioms. Thus, idioms are the least complex because they allow no variation. At the second level, the collocations are still fixed but the meaning is not idiosyncratic and rather more transparent because it is composed from the meanings of all of the components. Therefore, they are a bit more complex because the meaning has to be composed from several lexemes. At the third
level, the collocations have a slot that can be selected from a limited list of words, whose meaning is quite similar. This choice introduces both variation and complexity. At the fourth level, collocations have two slots and they are more variant and complex because two words at two points can be selected. Thus, the farther the level is from idioms, the more variation and more complexity the word combinations contain.

Cowan (1989) also takes into account four criteria: a degree of syntactic frozenness, resistance to lexical substitution, some degree of semantic opacity and one orthographic word, the fourth of which was originated by him. He maintains that the third criterion, semantic opacity, is especially inevitable to ultimately distinguish collocations and idioms. He also mentions that judging the degree of semantic opacity and metaphoric abstraction involves subjective judgments.

Although Fernando (1996, pp. 30-38) lists only two criteria, fixity and non-literalness in contrast to three criteria proposed by Nattinger and DeCarrico (1992), Carter (1987) and Korosadowicz-Struzynska (1980) and four criteria by Cowie and Howarth (1996) and Cowan (1989), he provides a systematic framework of idioms and habitual collocations. According to Fernando (1996), idiomaticity is inevitable in order to classify word combinations, which mainly consist of idioms and habitual collocations. Idiomaticity can be defined as "a scale which demonstrates the shading off of sub-classes of idioms into one another as well as the overlap between idioms and their lexical kin, collocations" (Fernando, 1996, p. 31) and fixity and non-literalness are two main factors to judge the degree of idiomaticity. As they are a matter of degree, idioms and habitual collocations can range from the completely fixed and semantically non-literal to unrestricted and literal.

Idioms and habitual collocations are characterized by fixity and literalness as shown in Figure 4.

## Idioms

| I | pure idioms |
| :--- | :--- |
| $\mathbf{a}$ | invariant, non-literal <br> devil-may-care, backlash, chin wag, red <br> herring, make off with, spick and span, smell a <br> rat, the coast is clear, etc. |
| $\mathbf{b}$ | restricted variance, non-literal <br> pitter-patter/pit-a-pat, take/have forty winks, <br> seize/grasp the nettle, get/have/cold feet, etc. |

| II | Semi-literal idioms |
| :--- | :--- |
| a | invariant <br> drop names, catch fire, kith and kin, foot the bill, <br> fat chance you've got, etc. |
| b | restricted variance <br> chequered career/history, good morning/day, <br> blue/film/story/joke/gap/comedian, etc. |

| III | Literal idioms |
| :--- | :--- |
| a | invariant <br> on foot, one day, in sum, in the meantime, on the <br> contrary, arm in arm, very important person <br> (VIP), potato crisps, tall, dark and handsome, <br> waste not, want not, happy New Year, etc. |
| $\mathbf{b}$ | restricted variance <br> opt in favour of/for, for example/instance, in <br> order that/to, happy/merry Christmas, etc. |

## Habitual collocations

$\Leftrightarrow \quad$| $\mathbf{I}$ | Restricted variance, semi-literal <br> explode a myth/theory/notion/idea/belief, catch <br> the post/mail, thin/flimsy excuse, etc. |
| :--- | :--- |

| II | Restricted variance, literal <br> addled/brains/eggs, in-the-not-too-distant <br> past/future, for certain/sure, potato/corn/wood, <br> etc. chips, etc. |
| :--- | :--- | :--- |
| III | Unrestricted variance, semi-literal <br> catch a bus/plane/ferry etc. train, run a <br> business/company, etc. theatre, by dint of hard <br> work/patience/repetition, etc. |
|  | IV |
| $\Leftrightarrow$ | unrestricted variance, literal <br> beautiful/lovely, etc. sweet woman, <br> smooth/plump, etc, glowing/rosy cheeks, etc. |
| $\mathbf{V}$ | restricted variance, literal optional <br> elements usually dropped <br> shrug (one's shoulders), nod (one's head), clap <br> (one's hands), etc. |

Figure 4. Multiword expressions by Fernando (1996, p. 32)

Idioms can be divided into three sub-classes: pure idioms, semi-idioms and literal idioms. A pure idiom is defined as a type of conventionalized or restricted variant, and non-literal expression (Ia and Ib). For example, spill
the beans has nothing to do with beans or at least no longer, even though some historical connection may exist. A semi-idiom is defined as a type of expression which has one or more literal constituents and at least one with a non-literal subsense, usually special to that co-occurrence relation and no other (IIa and IIb). For example, when drop has the meaning mention only when it co-occurs with names. Some of these semi-idioms seem to be overlapped with habitual collocations which can range from restricted variance, literalness to unrestricted variance, unliteralness. Literal idioms meet the salient criterion for idioms: invariance or restricted variation, but they are less semantically complex than pure and semi-idioms like on foot and for example/instance. Habitual collocations, which belong to the other column, but which show idiomaticity, permit lexical alternatives, either restricted or unrestricted. For example, addled eggs/brains are restricted habitual collocations and catch a bus/train/tram are unrestricted habitual collocations.

Fernando's table to demonstrate the shading off of idioms and collocations is useful for understanding the concept and scale of them. However, some examples are dubiously chosen. For example, potato crisps and potato chips belong to restricted literal idioms and restricted literal habitual collocations respectively, but the reason of the distinction is not clear. In order that/to in restricted literal idioms is concerned with not word combination but grammar. Two examples in unrestricted habitual collocations are wrongly described and should be replaced by followings: catch a bus/plane/ferry/train, etc. and run a business/company/theatre, etc. Thus, some examples should have been selected and written more carefully. Considering the idiomaticity that Fernando defines above, Glaser (1988,
pp. 265-272) introduces the definition of idiomaticity as an established term for the semantic property of an idiom, which is a stricter definition than that of Fernando (1996). Fernando and Flavell (1981) make a hypothesis that idiomaticity has two scales, language user judgment and structural properties. In order to answer the hypothesis, they examine which word combinations are regarded as idioms by language users and what factors make them identify the word combinations as idioms. As a result, sitting on a time bomb, stood down/stand-downs ranked high in the analysis. The criteria with which the word combinations are regarded as idioms are idiomaticity (54\%), commonness of use and familiarity (34\%) and awareness of a break in the coherence and cohesion of the text if the idiom were interpreted literally (25\%).

Benson et al. (1986, pp. 252-253) briefly explain free combinations, idioms and collocations. These lexical combinations are categorized according to the following three criteria: degrees of cohesiveness or range, semantic opaqueness, and frequency; however, they can be presented along a continuum and the boundary between the three categories is not clearly set.
(a). Free combinations

Free combinations occur the most frequently. Their constituents are able to be combined freely with the widest range of other lexical items. In other words, they are the least cohesive of all combinations. For example, the noun murder can be used with many verbs: to analyze, boast of, condemn, describe, disregard, film, forget, remember and so on. These verbs, in turn, can be combined freely with other nouns: accident, adventure, discovery, event, experience, etc. (1986, pp. 252-253).
(b) Idiom

Idioms are made up of a smaller group of word combinations and relatively frozen expressions whose meanings do not reflect the basic literal meanings of their constituents. For example, to have an axe to grind (= to seek personal advantage) and to have one's back to the wall (= to be in a desperate situation) are idioms (1986, pp. 252-253).
(c) Collocation

Collocations are loosely fixed pairings between free combinations and idioms. For example, commit murder is not an idiom, because the meaning of the whole reflects the meaning of the constituents. Moreover, this word combination is also different from free combinations in two ways. Firstly, perpetrate seems to be only synonym of the verb which can replace commit. Secondly, and more importantly, the combination commit murder is used more frequently (1986, pp. 252-253).

Benson et al. (1986, pp. 252-253) add more explanation for idioms. Although they are often called frozen expressions, they allow limited variability like Fernando (1996, pp. 30-38). Grammatical or lexical variability is possible for many idioms. For example, we'll kill (or we killed) two birds with one stone and mind one's (or one's own) business are acceptable. Gramley and Pätzold (1992, p. 73), as well as Cowie (1994, p. 3170), point out that many idioms have two meanings: a literal and an idiomatic one. They give the examples kick the bucket, go to the country, pull one's leg and so on. Gramley and Pätzold indicate that only context makes the intended meaning clear.

There are also some composite units such as foot the bill and curry favour which colligate collocations and idioms (Cowie, 1981, p. 228). These units have been called bound collocations or transitional collocations (Cruse, 1986, pp. 41-46). Cruse explains that transitional collocations require a particular item in their immediate context. In other words, the constituents forming the transitional collocations are not likely to be separated. Furthermore, he distinguishes them from idioms by stressing that their components are modifiable as in the following example (1986, p. 41):

## I'm expected to foot the bill

the electricity bill.
all the bloody bills!

Cruse (1986, p. 46) points out that transitional collocations are more frozen than ordinary collocations, but have a meaning close to that suggested by their component parts in contrast to idioms. One outstanding characteristic of combinations occurring in this group is that they are mostly used in their abstract meaning.

Weinreich (1969) and Altenberg and Eeg-Olofsson (1990) advance their opinion on idioms, collocations, and free combinations in their own ways. Weinreich's main interest (1969) is what idioms are and how they are different from non-idiomatic expressions. He considers a phraseological unit as a collocation and defines it as "any expressions in which at least one constituent is polysemous, and in which a selection of a subsense is determined by the verbal context, a cluster of characteristics that occur separately" (1969, p. 42). For him, idioms are expressed to involve at least
two polysemous constituents and a reciprocal contextual selection of subsenses, while free constructions are expressed to involve no polysemous constituents and be non-phraseological units. Thus, whether the word combination is an idiom, a collocation, or a free construction depends on how many of the constituents are polysemous.

In order to clarify his concept, he explains it with the example of red herring (in Amosova 1963, cited in Weinreich 1969, p. 42). When specialized subsenses are not taken into consideration, the expression means a fish of a certain kind, colored the color of blood and it belongs to free constructions. When red is selected as a specialized subsense and it refers to a herring smoked and cured with saltpeter, it belongs to phraseological units. The expression means phony issue, when the combination is opposed to the first two senses and the selection of subsenses is two-directional; there is no semantic relation between the subsenses of the components and the selecting feature is morphemic, so it is an idiom.

Altenberg and Eeg-Olofsson (1990) think that the fuzzy borderline between idioms, free combinations, and collocations is caused by the interpretations of collocation. In its broadest sense, collocation is regarded as recurrent word combination, while in a stricter sense, it is regarded as habitually co-occurring lexical items or mutually selective lexical items as the Firthian linguists generally interpret it. They claim that the broad sense focuses on specific word sequences such as idioms, compounds, and complex words, but the stricter sense is concerned with the relationship between lexical items in language and it may operate across word classes (e.g. drink heavily, heavy drinking). In the stricter sense collocation does not necessarily include idioms and other word sequences, but may include discontinuous
items (e.g. he drinks pretty heavily), and may allow lemmatization (e.g. drink/drinks/drank/drinking heavily) (1990, p. 4).

There are linguists who do not attempt to distinguish between idioms and collocations. Ridout and Clarke define collocation as "a group of words frequently found together and producing collectively a meaning not apparent from the meaning of each component part of the group" (as cited in Seaton, 1982, p. 25). This definition seems to equate collocations with idioms. Wallace (1979, p. 69) describes collocations as a class of idioms, which are defined in terms of a necessary condition, decodability (= opaqueness), i.e. how easily the expressions are decoded from the meaning of their constituent elements, but in the last section he attempts to differentiate idioms and collocations for the pedagogical need. According to the degree of decodability, idioms are classified as opaque or transparent if they are easily decoded. Idioms falling into the area of transparent expressions are called restricted collocation and only opaque expressions are called idioms.

Nagy (1978, p. 296) also points out that some non-idiomatic expressions are referred to as idioms, citing Fraser's definition of idioms as "a constituent or series of constituents for which the semantic interpretation is not a compositional function of the formatives of which it is composed and no part of which contributes to the semantic interpretation of the expression" (Fraser, 1970, p. 20, cited in Nagy 1978, p. 296). For example, Ross (1970) lists hold one's breath and lose one's temper as idioms, but they cannot be idioms, according to Fraser's definition. He also shows that the expressions such as take a bath are idioms. Lehrer (1974, p. 187) confesses that a fairly large part of idiomatic constructions remain to be studied, although the semantic position that the co-occurrence of words is the result of their
meaning is basically correct for most sentences. As lexical co-occurrences that are arbitrarily restricted are considered to be like idioms, i.e. linguistically non-productive, idioms are not the subject of research in the semantic field because the aim of a linguistic description in the field is to describe and explain the productive processes of language.

As stated above, many linguists attempt to distinguish among idioms, collocations, and free combinations according to the linguists' own criteria, although the three word combinations are all along a continuum but have an unclear boundary between them. Two criteria are common among the linguists listed above: (a) semantic opacity, which means that the meaning of the combinations is retrievable from each constituent, and (b) collocational restriction, which means that another synonymous word can be substituted for the constituent word in the word combinations. However, different linguists have different terms for these two criteria. They are summarized below:

Table 2. Various names for two criteria

| (a) | semantic opacity | Fernando (1996), Cowie and Howarth (1996), Carter (1987), <br> Korosadowicz-Struzaynska (1980), Cowan (1989), Gramley <br> and Pätzold (1992) |
| :--- | :--- | :--- |
|  | semantic opaqueness | Benson et al. (1986), |
|  | compositionality | Nattinger and DeCarrico (1992) |
|  | transparency | Aisenstadt (1979) |
|  | decodability | Wallace (1979) |
|  | collocational restriction | Carter (1987) |
|  | fixity | Fernando (1996) |
|  | variance | Cowie and Howarth (1996) |
|  | commutability restrictions | Aisenstadt (1979) |
|  | combinational flexibility | Nattinger and DeCarrico (1992) |
|  | cohpossibility of passivization | Korosadowicz-Struzaynska (1980) |
|  | lexical substitution | Benson et al. (1986), Gramley and Pätzold (1992) |

### 2.2.2. Terminology problem

The previous section showed that different linguists name two criteria to distinguish idioms, collocations and free combinations in various ways. Collocation itself is also referred to in different ways, as reflected in its characteristics (Cowan 1989, pp. 25-26). Bollinger does not think that it is necessary to make a differentiation of the three word combinations and says that "it is of course, a matter of terminology whether collocations should be classes separately from idioms or as a major sub-class" (1976, p. 5). On the other hand, Gitsaki (1999, pp. 31-32) criticizes the large repertoire of the terms over the years used by linguists and stresses the need for a more precise definition and categorization of collocations. Terms for collocation including Gitsaki's (1999, p. 32) is listed below:

Table 3. Various terms for collocation
conventional syntagmes (Korosadowicz-Struzynska, 1980), semitransparent expressions (Yorio, 1980), restricted collocation (Cowie \& Howarth, 1996; Cowie, Mackin \& McCaig, 1983; Howarth, 1998a, b; Aisenstadt, 1979), habitual collocation (Fernando, 1996), recurrent combination, fixed collocation (Cruse, 1986), idioms of encoding (Makkai, 1972), partial idiom (Palmer, 1976), memorized sentences and lexicalized stems (Pawley \& Syder, 1983).

### 2.3. Previous studies on collocations

### 2.3.1. Descriptive studies

Researchers started collocation studies with the assumption that words receive their meaning from words they co-occur with, and attempted to describe it from their own perspectives.

Collocation studies can be traced back to the work of H. E. Palmer, who is said to be the first linguist to use the term collocation in the present-day sense. In Palmer's Second Interim Report on English Collocations (1933) and This Language-Learning Business (1969), he defines collocation as word
combinations which contain one or more words having meanings only in that collocation. This completely hinders learners from acquiring the whole range of collocations from weak collocations (e.g. see a film and an enjoyable holiday) to the strongest and most restricted collocations (e.g. see reason and burning ambition)

In both of his articles, he highlighted the importance of collocation in the successful language learning. He stressed this because some English teachers fail to realize the existence of abundant collocations, especially irregular collocations, which consist of semantically opaque constituents of words such as foot the bill. In order to acquire a wide range of collocations, he points out the necessity for both teachers and students to be aware of the need for collocation acquisition.

Although Palmer pioneered collocational research, Firth's definition of collocations (1957) and his stance that lexical studies in terms of syntagmatic aspects are important and that collocations play an important role in word's meaning had a greater influence on his followers' studies on collocations. His main concern is literary stylistics, where it is necessary to recognize the distribution of words and certain collocations in order to explain literary effect. His definition of collocations is deduced from many examples of literary works sharing common classical sources. He explains collocations as follows (1957):

The statement of meaning by collocation and various collocabilities does not involve the definition of word-meaning by means of further sentences in shifted terms. Meaning by collocation is an abstraction at the syntagmatic level and is not directly concerned with the conceptual or idea approach to the meaning of words. One of the meanings of night is its collocability with dark, and of dark, of course, collocation with night. This kind of mutuality may be paralleled in most languages. (p. 196)

In other words, collocation refers to co-occurring associations of two or more lexemes in a specific range of grammatical constructions and "mutual expectancy of words" (p. 196) is a distinguishing feature of collocations.

Firth also describes two ways of investigating collocations (1957, p. 196): (a) the stylistics of what persists in and through changes, and (b) the stylistics of personal idiosyncrasies; and both of these influence the followers' studies, like Sinclair (1966, 1991, see section 2.3.2.).

According to Bollinger and Sears (1968), who follow the Firthian concept of collocations, the syntactic and habitual association of words, "the characteristic company they keep" (1968, p. 53) with external reality is regarded as collocation. They explain the process of word acquisition by using holophrastically and horizontally. First a child apprehends the verbal expression holophrastically: In other words, he/she expresses an undivided word representing a total context. After that, he/she can differentiate larger combinations of words horizontally, in more extended pieces of speech based on the syntax. They point out that collocations are acquired relatively later through the process of L 1 vocabulary acquisition.

Replying on Firth (1957), who stresses the importance of lexical studies in descriptive linguistics and regards the statement of collocations as the most useful approach, Halliday (1966) is concerned with how collocation defines membership of lexical sets, which are "groupings of members with like privilege of occurrence in collocation" (1966, p. 153) and proposes the lexico-grammatical system in his own framework as follows:

Table 4. Lexico-grammatical system by Halliday (1966, pp. 152-153)

|  | grammar | lexis |
| :---: | :---: | :---: |
| paradigmatic axis | system | set |
| syntagmatic axis | structure | collocation |

According to his framework of a language system, collocation is one of the main components and central part in his lexico-grammatical system. He defines collocation as a syntagmatic relation of words which is linear co-occurrence together with some measure of significant proximity (1966, p. 152) and says that collocational relations intersect with structural ones. He points out that grammar does not always give an explanation of the relations between strong and powerful. In fact, strong and powerful are both members of a set of items and both of them collocate with argument, but they cannot always collocate with the same words. While strong car and powerful tea will either be rejected as ungrammatical (or unlexical), strong tea and powerful car can be acceptable. This explains that both of them depend on the syntagmatic relation into which each enters but that collocational patterning is independent of grammatical structures (1966, p. 150).

In relation to the notion of collocation and lexical set, Malmkjaer (1991) explains that it can be exploited in decision making on polysemy and homonymy. The different collocational environments associated with the word bank, (e.g. cheque, deposit, manager, money, etc.) and bank (e.g. river, water, earth, trees, etc.) show that bank is a homonym (Malmkjaer, 1991). In the meantime, non-cognate word forms (e.g. city and urban) have the same collocations. Therefore, it can be shown that they belong to the same set (1991, p. 303).

Greenbaum (1960) and Mitchell (1971) also follow the Firthian concept of
collocations. They study collocations from an integrated approach of lexis and grammar and define them as association of words whose lexical and syntactic patterning is viewed as distinct but interrelated. They emphasize that in collocation study, the lexical view should not be separated from the syntactic view, because the collocational meaning is changed according to different syntactic patterning (Greenbaum, 1960, p. 12; Mitchell, 1971, p. 50).

Greenbaum (1960, p. 12) claims that limited, homogeneous grammatical classes yield the most useful analytic results and points out that a serious disadvantage of an item-oriented approach in the collocation study is that ignoring syntactic restrictions on collocations leads to inaccuracy. In other words, both lexical and syntactic patternings are important to fix collocations. If either is incorrect, then the phrase product is not a collocation. Greenbaum exemplifies the advantage of interrelated patterning between lexis and syntax by using an item much:

Much collocates with like in negative sentences, not in affirmative sentences.

I don't like him much.
But not *I like him much.
However, if pre-modifiers are added to much in affirmative sentences, it can be acceptable:

I like him very much/ too much/ so much.
(Greenbaum, 1960, p. 12)

Mitchell (1971) has the same opinion as Greenbaum and maintains that the meaning of collocations is influenced not only by their contextual extension of lexis but also the generalized grammatical patterns within
which they appear. He focuses on morphemes of words and explains that words which contain the same lexical morphemes do not necessarily mean the same when rearranged or inflected. For example, hard in hard work means something different from hard in hard-working.

In addition to explaining collocations and illustrating them with some examples, McIntosh (1961, p. 193) proposes a useful framework of four categories for the determination of style in language as follows:

#### Abstract

There is the possibility of four obviously distinct stylistic modes: normal collocations and normal grammar, unusual collocations and normal grammar, normal collocations and unusual grammar, unusual collocations and unusual grammar. (p. 193)

He argues that "normal collocations are too familiar and thus banal and abnormal collocations are unfamiliar and thus indecipherable" (1961, p. 193). In order to bridge the gap, standard language norms are necessary, because without this, it becomes impossible to communicate, as no one has the same experience or set of associations.

McIntosh also claims that native speakers of English are the only people who can produce new word combinations, using their intuition of the collocational range of words. He describes their intuition of new formations as "range-extending tendencies" (1961, p. 193). An example of collocation which has been created in this way is the lexical item key which has recently considerably extended its range: key move, component, policy, etc. Collocational acceptability including new formations can be statistically analyzed on large corpora which are the product of native-language speakers.

However, this argument of McIntosh is invalid in the background that English is now regarded as an international language around the world. Crystal (2003) updates Kachru's (1992) model showing the English-speaking population and explains as follows: In the Inner Circle, 320 to 380 million people use English as a mother tongue; in the Outer Circle, 300-500 million people use English as a second language; and in the Expanding Circle, 500 million to one billion people use English as a foreign language. This figure indicates many non-native speakers around the world communicate with each other in English. Therefore, there is a great possibility that new word combinations spoken by not only native speakers but also non-native speakers of English can be mutually intelligible and acceptable.

Carter (1987, pp. 36-57), who is like a bridge between Greenbaum (1960), Mitchell (1971) and McIntosh (1961), fundamentally follows Firth's definition of collocations. He describes them as a group of words which co-occur repeatedly, and studies these patterns of co-occurrence grammatically and lexically. Grammatical studies look at the needs of particular pedagogic projects for ESL or EFL learners, while lexical studies aim to find the lexical patterning of texts and tend to make use of computerized lexical research. Carter emphasizes that because both grammatical patterning and lexical patterning influence the meaning of collocations, the study should include both of them, as do Greenbaum (1970) and Mitchell (1971).

Carter also explains collocation in terms of frequency and range as does McIntosh (1961) and above all, he stresses that the latter is the most suitable tool to describe the collocational restriction. He shows the difference of ranges between words, using some examples which shed light on his idea.

Good examples he gives are putrid, rotten, rancid and addled, which have restrictive ranges and refer to a substance which has decayed and can no longer be used. Putrid collocates with fish, rancid with butter, oil, lard, etc., and addled is confined only to eggs, while rotten can collocate with fish and eggs and also with fruit. Thus, these properties of rotten mean that by this criterion it is a core word and, by contrast, putrid, rancid, addled are less core. In short, synonymic relations between words can be usefully distinguished with reference to the different collocational ranges of the synonyms involved. He concludes that this aspect of collocation is a valuable and revealing one and is one of particular relevance to vocabulary in language teaching.

The focus of Jackson (1988) is different from those of Greenbaum (1960) and Mitchell (1971), who are interested in the explanation of collocations in terms of not only a lexical view but also a grammatical view. Jackson also differs from McIntosh (1961), who focuses on productivity of new collocations by native speakers of English. He highlights the difference between collocations and idioms and states that "collocation is not a fixed expression, but there is a greater than chance likelihood that the words will co-occur" (1988, p. 96). For example, in the sentence, "He had a false $\qquad$ ," the nouns that fill the slot in this structure might include eye, nose, beard, expectation or passport. Without the article in this structure, teeth and eyebrows could be added. If the subject of the sentence were the car rather than he, numberplate might be expected. Thus, unlike idioms, collocations are combinations which regularly keep company not with one word but with certain other words.

Jackson also refers to a certain mutual expectancy, range and
collocational restriction, which are important features in collocations. Especially, regarding mutual expectancy, which is reminiscent of Firth's definition, he exemplifies this using tooth and false. Tooth is more likely to collocate with false than false is to occur in combination with tooth, because a number of alternative nouns can be combined with false such as eye, nose, beard, expectation and paper, while tooth can be combined with fewer adjectives such as irregular and decayed.

Finally he points out (a) the importance of the corpus of spoken and written text and (b) the importance of lexicographers' intuitions and insights into their own and fellow-speakers' knowledge of language use in compiling dictionaries, and (c) criticism for the different state of treatment of collocations in some dictionaries (1988, pp. 99-103).

Aisenstadt (1979) is also concerned with describing collocations, compared with idioms and free combinations (see section 2.2.1) and considering certain characteristics of them. He introduces four characteristics. One is that restricted collocations have various structures (e.g. $V-N, A-N$ and $V-A d v$ ) and the patterns are command admiration, attention, decision and so on. The second is that the meaning of restricted collocation constituents may be characterized by one of the following: (a) the constituents have a very narrow specific meaning which does not allow a wide range of commutability (e.g. shrug one's shoulders), (b) the constituents are used in a secondary meaning, often abstract or figurative (e.g. clench one's hands, clench one's fists), or (c) the constituents have a weakened and grammaticalized meaning of verbs, which can be changed result in a possible interchange of those verbs (e.g. give a laugh, have a laugh). The third is that the commutability between the restricted collocation constituents may be
restricted in the following: (a) both constituents of restricted collocations are restricted to a limited number of co-occurring words (e.g. shrug one's shoulders, square one's shoulders, hunch one's shoulders), or (b) the commutability of only one constituent of the restricted collocation is restricted (e.g. make a decision, take a decision). The fourth is that while many restricted collocations belong to the neutral layer of vocabulary, a certain number is mainly colloquial.

The interest of Halliday and Hasan (1976) is related to lexically predictable collocational chains that extend beyond the boundaries of a sentence in textual cohesion, different from those of other linguists who pay attention to idiosyncratic and unpredictable co-occurrences of words. They define collocation or collocational cohesion as all the various lexical relations which do not depend on any systematic semantic relation but which have the tendency to share the same lexical environment such as bee...honey and walk...drive. This is simply a cover term for the cohesion in which lexical items are associated with each other in some way or other.

Collocations are systematically defined from multi-criteria by Gramley and Pätzold (1992) and Nation (2001). It seems that each concept of collocations is slightly different from that of earlier researchers in terms of the synthetic description. Gramley and Pätzold (1992) and Nation (2001) maintain that only one criterion is not enough to define collocations and that "the large number of scales needed is evidence of the range of items covered by the term" (Nation, 2001, p. 329).

Gramley and Pätzold define collocations as "combinations of two lexical items which make an isolable semantic contribution, belong to different word classes and show a restricted range" (1992, p. 61). This definition is based on
six main criteria, which are discussed in detail below:

## 1. Two lexical items, not grammatical ones

This refers to what is defined as collocations mentioned above.
e.g.) strong coffee, white currant
2. Two categorizations: lexical combination and grammatical combination

In accordance with Benson et al. (1986), collocations can be divided into lexical combinations and grammatical combinations (see section 2.3.4).

- Lexical combination - dominant words only (noun, adjective, adverb and verb)
e.g.) compose music, strong tea, affect deeply
- Grammatical combination - dominant words + preposition or a grammatical construction
e.g.) by accident, apathy towards, angry at

## 3. Independent meaning of constituents

This means that the "individual constituents contribute to the meaning of the combination as a whole" (p.62). In other words, each constituent of a collocation can have special meanings which are restricted to one particular collocation, and the more opaque some individual constituents are, the more closely they are linked to the other constituents. This important point about collocational meaning helps to set up two different classes: collocations and idioms.
e.g.) white paint, white grape $<$ white lie (= harmless), white night (= sleepless) < white horses (= white-topped waves), white coal (= water as energy source) ('<' means more opaque)

## 4. Word classes

Lexemes belong to different word classes such as demand-meet (noun-verb), face to face (noun-preposition-noun) and apologize-profusely (verb-adverb).

## 5. Range

This means that items are different in terms of their close relationship to other items and this criterion helps to distinguish between free combinations and collocations. In the case of decide on a boat, if the meaning is choose (to buy) a boat, then it contains the collocation decided on, while if the meaning is make a decision while on a boat, it is a free combination (cited in Benson et al., 1997). The number of free combinations is limitless and the BBI dictionary (Benson et al., 1997) is made up of only collocations.
6. Fixedness

Different collocations have different degrees of fixedness.
(a) Morphology

In some collocations, adverbs do not form the -ly morpheme such as swear-blind and forget-clean.
(b) Substitutability

In some collocations, constituents can be replaced by their synonyms.

For example, hardened criminal and confirmed criminal are acceptable, although *hardened burglar or *hardened murderer are not.
(c) Additions and Deletions

Additions have taken place frequently, while deletions are much rarer. In case of additions, most often pre- or post-modifying nouns are normal.
e.g.) The oil-exporting nations...may soon restrict production below the level needed to meet still rising world demand. (demand-meet; B. Ward, Progress for a Small Planet, p. 15)
(d) Displacement

Personal pronouns can be substituted for constituents in some collocations:
e.g.) Quality is our promise. Cancellation is your privilege if we fail to meet it. (advertising material, The Economist, May 1991)
(e) Separability

In some collocations, word combinations, which belong to bound collocations (Cruse, 1986, p. 41) can not be separated, such as foot the bill and curry favor.
(f) Distribution

The distribution in collocations is relatively changeable. For instance, They met their demands; their demands, which were not met completely... are both acceptable.

As mentioned above, many criteria have to be met in order to regard word combinations as collocations. Nevertheless, it can be said that collocations themselves are vague because of a low degree of formal fixedness in
combinations with the composite semantic structure. Gramley and Pätzold argue that one solution to distinguish between collocations and other word combinations is to rely on one of objective criteria, the frequency of co-occurrence of words in corpus-based research.

Nation (2001) argues that using a set of scales is the most effective way of setting up criteria for grouping items as collocations, and setting up the groups of collocation and 10 scales which have been identified by many researchers would be needed to do it. Compared with the criteria Gramley and Pätzold (1992) present, the criteria of Nation (2001) are further segmentalized, including criteria 3, 4, 5 and 6 of Gramley and Pätzold (1992). Nation's 10 criteria are as follows:

1. Frequency of co-occurrence

A very important criterion is this frequency of co-occurrence, which should be considered along with collocation range and which is measured by computers in large corpora (see Kjellmer, 1984 in Computational Study).

## 2. Adjacency

Collocates can occur from next to each other or be separated by variable words or phrases like an example, "little did $x$ realize" (see collocational frameworks examined by Renouf \& Sinclair, 1991 in Computational Study).

## 3. Grammatically connected

Collocates can usually be seen within the same sentence as part of a grammatical construction, but it is possible to see items within the same text, not grammatically connected to each other but in a lexically cohesive
relationship as collocates. Kennedy gives such an example ${ }^{1}$ as: "Her uniform was of rich raw silk in a shade which matched her hair" (1998, p. 113). In this sentence, silk and shade can be regarded as collocates in a lexically cohesive relationship.

## 4. Grammatically structured

In addition to habitual co-occurring of words, another criterion, grammatically structured should be needed. For example, although he and of the should not be contained in collocations which take account of the major divisions that would be made in analyzing a clause, although they occur so often (see Kjellmer, 1982 in Computational Study).

## 5. Grammatical uniqueness

Collocations range from grammatical uniqueness (e.g. hell for leather) to grammatically regular patterns (e.g. weak tea) with patterned exceptions like go to bed/town/hospital (without an article) as the mid-point.

## 6. Grammatical Fossilization

Collocations range from no grammatical variation (e.g. by and large) to changes in part of speech (e.g. Her heart wasn't very strong and her life assurance premiums weren't cheap. It cannot have been easy to meet them. [cited in Gramley and Pätzold, 1992, p. 65]) with inflectional change (e.g. He kicked the bucket.) as the mid-point.

[^0]
## 7. Collocational specialization

Collocations range from always mutually co-occurring (e.g. commit suicide) to all occurring in a range of collocations (e.g. hocus pocus) with one bound item (e.g. kith and kin) as a mid-point. Collocational specialization is equivalent to what Aisenstadt (1981) calls restricted commutability.

## 8. Lexical fossilization

Collocations range from unchangeability (e.g. No fear!) to allowing substitution in all parts (e.g. last month) with allowing substitution in one part (e.g. permit/allow/give access to [cited from Schmitt, 2000, p. 79]) as a mid-point. These criteria indicate that collocations from this entire range should be included when counting the frequency of collocations.
9. Semantic opaqueness

Collocations range from semantic opaqueness (e.g. of course) to semantic transparency (e.g. open the door). This criterion and grammatical fossilization are commonly used to define an idiom.
10. Uniqueness of meaning

Collocations range from only one meaning (e.g. on behalf of) to several meanings (e.g. kick the bucket has two meanings: to die and to kick the bucket with your foot) with related meanings as the mid-point.

Nation points out that the ranges in each of the 10 criteria have all been graded from most lexicalized to least lexicalized and gives the example of hocus pocus as a highly lexicalized collocation according to the 10 criteria.

However, criteria 1 and 2 are not regarded as relative scale, but absolute scale by computational linguists who try to indicate objective criteria such as counting and calculating frequency and range with statistics and computer techniques to identify collocations.

In summary, Firth's definition of collocation and his stance have been strongly supported by his successors in Firthian studies, who have further developed his concept. Collocations have recently tended to be defined from more and more angles, using an increasing number of different features. However, it seems difficult to identify collocations according to the definition of collocations which linguists in the descriptive studies argue, because many linguists only rely on the subjective criteria such as semantic opacity and collocational restriction.

### 2.3.2. Semantic studies

Semanticists criticize the studies of collocations by Firth and his followers as insufficient and attempt to investigate collocations in terms of semantic framework and syntagmatic lexical relations under the scope of semantics. In spite of mentioning some shortcomings of the collocational studies by Firth and his followers, they do not give strong enough support for their concept and the function of collocations.

Lyons (1966), Palmer (1976), Katz and Foder (1963) and Lehrer (1974) criticize Firthian studies of collocations and attempt to explain them in the semantic field.

Lyons (1966, pp. 289-297) considers Firth's treatment of collocations as insufficient in that he only places collocation in an intermediate level between grammar and situation, but he never defines the notion of
collocation in his general theory. Firth (1957, p. 196) states that "one of the meanings of night is its collocability with dark, and of dark, of course, collocation with night." Moreover, Firth introduces and exemplifies the notion of collocation and gives an answer for the question, "what collocations are synchronically acceptable or unacceptable?" by an analysis of Swinburne's poetic diction and of certain letters of the $18^{\text {th }}$ and early $19^{\text {th }}$ centuries. One of the findings in his analysis is that certain collocations remain current over long periods of time, whereas others do not. However, Lyons thinks that the analysis is not synchronic nor should the collocations shown by Firth be considered as collocations of units but as idioms. He suggests that collocations should be studied as part of the synchronic and diachronic analyses of language. Unfortunately, Lyons provides only criticism of the Firthian theory of meaning without any concrete alternatives.

Similar to Lyons (1966), Palmer (1976) also criticizes Firth's treatment of collocation as merely part of the meaning of a word and his limited concern with the more obvious and more interesting co-occurrences, the mutual expectancy of words. His argument as a semanticist is that there is a restriction on the use with a group of words that are semantically related, which is the matter of range suggested by McIntosh (1961). He also states that there are three kinds of collocational restrictions: collocations based wholly on the meaning of the item as in the unlikely green cow, collocations based on the range which is characterized as some semantic features in common as in the unlikely the rhododendron passed away and collocations based on collocational restrictions in a strictest sense, with neither meaning nor range as addled with eggs and brains.

Katz and Fodor (1963, pp. 172-173) argue that a semantic theory of a language would "take over the explanation of the speaker's ability to produce and understand new sentences at the point where grammar leaves off" (pp. 172-173), and try to establish the semantic theory which would organize and systematize facts about meaning of lexical items which are perceived as a combination of the semantic properties, free from grammar. They also attempt to explain collocations with these semantic concepts of theirs. They are reflected in a language dictionary, in which words contain a selection restriction and can be explained with a semantic marker. In this way, they seem to consider that the semantic approach is more likely to explain why words can be found together.

Lehrer (1974, pp. 173-176) provides a more comprehensive explanation for insufficiency of collocation studies by Firthian linguistics. From his semantic viewpoints, he points out some contradictory points in the lexical hypotheses whose stance is taken by Firth (1957) and Halliday (1966) as follows:

1. Firth never gives an exact definition or paraphrase of collocational meanings. In his 1957's paper, he mentioned that "meaning by collocation is an abstraction at the syntagmatic level" (cited in Lehrer, 1974, p. 174) and is not directly concerned with the conceptual approach to the meaning of words. Although he gives an example of night and dark as a collocation, he never gives a proper definition.
2. Halliday has attempted to discuss the notion of a collocational level in terms of a general theory of grammar, but he failed. There are two other
alternatives. One is that formal linguistic patterns can be explained with not only grammar but also semantic terms. The other is to recognize that there will still remain patterns which cannot be accounted for in formal linguistic patterns even after a grammar has been constructed.
3. Halliday recognizes that frequency of occurrence is necessary in collocation study, but he does not focus much on study of large corpora as a source of data on collocation and sets. It is important to notice which pairs of words occur with less than expected frequency, as well as those that occur with more than expected frequency.
4. Sinclair (1966) discusses a lot of theoretical and methodological problems involved in the study of text to discover collocational sets, but he includes deviant sentences such as poetry and fiction stories. It is important to use all kinds of discourse, not specific one in determining collocational sets.
5. Frequency studies are exaggerated as a useful way of determining what words belong together in a lexical set, but the more important question is what conclusions are to be drawn from the results. Furthermore, there is no explanation of why certain pairs of terms occur less often than expected.

Thus, Lehrer (1974, pp. 173-176) criticizes the lexical hypotheses in which Firth and other linguists cannot explain selection restriction in regard to the above five points.

Then he attempts to explain collocations with semantic features, but it seems to be extremely ambitious. Considering the direct object of smell,
[smellable] is useless unless every possible direct object for smell in the language can be covered with the feature [smellable]. For example, possible direct objects are more than physical objects like fresh air or stale smoke. If they are forced to be classified into physical objects, we have to accept the following examples, "He hit the fresh air with a stick" and "I smelled a rat", but we cannot.

He also referred to arguments of Leisi (1953), Gruber (1965) and McCawley (1970) who attempt to explain semantic restrictions with semantic features. They all exemplify paradigmatic contrasts involved in words so that differences of selection restrictions can be predicted on the basis of meaning and attempt to devise some features that would describe the rest of the cases. For instance, kick, slap and punch McCawley (1970, pp. 180-181) raised as examples refer to specific actions as well as to the instruments foot, open hand and fist. Kick can take as an instrument what can be put on or in some way attached to a foot like a He kicked me with a boot (slipper, skate, snowshoe, ski). Slap needs an open hand, a folded newspaper or even a fish (e.g. I held the fish between my toes and slapped the cat with it when she tried to eat it.), while punch means to hit a compact, hard and physical object with one's fist (e.g. He punched the wall angrily, then spun round to face her.) Although Lehrer (1974) admits McCawley's point of view that different words have certain distributable meanings, whether it is correct or least correct for most people remains to be worked out.

In conclusion, he proposes the mixed positions in which the lexical and semantic positions on lexical co-occurrence are combined, but he does not support any strong evidence for why the mixed position is possible.

Cruse (1986) considers collocations as one of the most important components in the semantic field. Cruse (1986) defines collocation in terms of three important points: frequency, collocational restriction and semantic opacity. According to Cruse (1986, p. 41), collocation is regarded as sequences of lexical items which habitually co-occur, which are highly restricted contextually, but which are basically transparent in the sense that each lexical constituent is semantic. Compared with idioms, collocations are semantically more transparent: however they have some distinctly idiom-like characteristics, too. For instance, foot the bill and curry favor, are not likely to be separated.

Cruse, who is similar to other semanticists, also describes collocational restrictions as "semantic and arbitrary co-occurrence restrictions" (1986, p. 279), by examining the syntagmatic meaning relations between lexical units. For example, kick the bucket is only used with a human subject, but its propositional meaning is merely die and not die in a characteristically human way. That is, "the restriction to human subjects is semantically arbitrary" (1986, p. 279). Then, the collocational restrictions are divided into three kinds from the viewpoint of the degree to which they can be set out in terms of necessary semantic traits. One is systematic collocational restrictions when they can be fully specified. For example, grill and toast denote the same process or action from the view of agents but different from the point of view of patients. They are different in the method that we grill raw food and we toast cooked food. The second is semi-systematic collocational restrictions when some collocations have certain exceptions. For example, customer gets something material in exchange for money, whereas client typically receives less tangible professional or technical service. The
last one is idiosyncratic collocational restrictions when their collocational ranges can only be illustrated by listing allowable collocates. For example, it is possible to say spotless kitchen but not to say flawless kitchen.

Since the 1990s, some linguists have been interested in semantic prosody, which is introduced by Sinclair (1991) and Louw (1993). It refers to "a consistent aura of meaning with which a form is imbued by its collocates" (Louw, 1993, p. 157) or "a standard distinction between aspects of meaning which are independent from speakers (semantics) and aspects which concern speaker attitude (paradigmatics)" (Stubbs, 2001, pp. 65-66) ${ }^{2}$. Prosody originated in phonological coloring which is able to go beyond segmental boundaries and Sinclair applies the term prosody to semantic features of collocations whose habitual collocates are capable of coloring them. As a corpus is being developed, semantic prosody, which is inaccessible through intuition, can easily be obtained through the objective examination of how language is actually used via computers. In other words, corpus linguistics reveals a greater mismatch between the products of introspection about language and those of extrospection and new objective language facts about language. Thus, collocation has been studied within the new semantic domain with the assistance of corpus linguistics.

Sinclair (1991) strongly argue that how carefully language is patterned can be gained by selecting text and considering all the instances by showing concrete examples. One example is a phrasal verb set in and by the search of the COBUILD corpus 114 examples are examined. His main finding is that set in commonly collocates with unpleasant states of affairs and only three

[^1]refer to the weather; a few are neutral, such as reaction and trend. What typically sets in is bad weather, decay, despair, rot and rigor mortis and not one of these is conventionally desirable or attractive. He recommends that building up these kinds of database for teachers' reference by accessing much more reliable information from corpora leads teachers to provide a more confident way of teaching to learners, although he shows no concrete materials for direct exploitation in the classroom.

Louw (1993) explores the possibility of semantic prosodies and suggests what role they may play in texts. In order to examine semantic prosodies of utterly which are found in Larkin's poems, 99 citations drawn from the original 18 million word corpus at COBUILD are analyzed. The concordance shows that utterly connotes bad as in utterly confused and utterly ridiculous. On the other hand, there are few good examples. In fact, only four examples are found as good but all of them carry a fairly obvious ironic intention. For the findings he makes a comment that they enable us to determine criteria for recognizing semantic prosodies, only because "the prosody on utterly is as consistent as it is that it admits the possibility for irony" (Louw, 1993, p. 164). Thus, large corpora allow us to extract profiles of semantic prosodies which reveal the real speaker's intention.

The aim of Stubbs' study is to demonstrate semantic prosody of lexical collocation, which is one of the norms of the use by investigating corpora, along with other linguists such as Sinclair (1991) and Louw (1993). He regards collocation as "the habitual co-occurrence of words and a purely lexical relation between words in linear sequence, irrespective of any intervening syntactic boundaries" (1995, pp. 245-246). In his later study (2001, p. 29), he clearly adopts the rather statistical stance that collocation
should be defined as frequent co-occurrence. He argues that in order to identify lexical collocations, semantic prosody should be examined by studying corpora of naturally occurring data. He gives a brief example of the semantic field of cause and effect by accessing corpora. Table 5 shows his explanation and examples.

Table 5. Semantic field of cause and effect by Stubbs (1995, pp. 252-253)

| words | semantic prosody | collocates |
| :---: | :---: | :---: |
| CAUSE | predominantly negative | accident, problem, disease, chaos, embarrassment |
| CREATE | neutral | condition, havoc, illusion, image, problems |
| REASON | not very clear | altruistic, apparent, cogent, compelling, different, earthly, good, main, obvious, political |
| RESULT | neutral | disappointing, end, expected, final, inconclusive, interim, preliminary, unintended |
| AFFECT | very negative | adversely, badly, directly, negatively, seriously |
| EFFECT | very negative | adverse, deleterious, devastating, dramatic, harmful, ill, negative, profound, toxic. |
| CONSEQUENCE | very negative | catastrophic, devastating, dire, disastrous grave, negative |

Stubbs recommends that teachers use such semantic prosody that cannot be obtained without corpus assistance and that it is very reliable information about collocations for pedagogical implication.

Rudanko (2001) is also concerned with examination of semantic prosody. He claims that the concept of connotation should be investigated not only at the level of images aroused by individual lexical items, but at that of collocational patterns, and in order to examine it, not the intuition of native speakers but large electronic corpora is needed. He supports Sinclair's study of the concept of collocational coloring in 1991, but points out the problem
that his study is limited because only present-day English is dealt with. Then, based on these claims of his and the problem of Sinclair's study, he examines changes of the collocational coloring of the verb set in, of the adjective bent and fraught and of the verbs cause and bring about in three different corpora of collected examples from the $18^{\text {th }}$ century, the $19^{\text {th }}$ century, and the $20^{\text {th }}$ century, for the three different centuries. The Chadwyck-Healey Corpus of $18^{\text {th }}$ Century Fiction, the Corpus of $19^{\text {th }}$ Century English, and the COBUILD corpus are respectively used for $18^{\text {th }}$ century English, $19^{\text {th }}$ century English and $20^{\text {th }}$ century English. The findings show that there can naturally be different degrees of collocational coloring in each target word. For example, the two verbs expressing causation, cause and bring about are different in collocational coloring. In present-day English, cause is apt to take a negative complement, whereas bring about has a neutral or positive complement. In the $19^{\text {th }}$ century, cause had a tendency to choose objects whose referents were ordinarily either neutral, or unpleasant in flavor, while bring about seemed less common in this century and tended to select objects which referred to events or things that were conventionally neutral or pleasant in flavor. In the $18^{\text {th }}$ century, cause had objects that referred to events, actions or properties that had a negative flavor, while bring about was less frequent than cause in this century and it accompanied relatively various objects. Thus, from his diachronic study, collocational coloring is found to change according to different centuries.

In summary, semanticists have criticized the studies of collocations by Firth and his followers and developed an approach to collocations in terms of the semantic framework and syntagmatic lexical relations under the scope of semantics. In the 1990s, thanks to the development of computer technology,
collocation has been studied in terms of a new semantic framework, semantic prosody, which is related to an objective criterion, frequency.

### 2.3.3. Computational studies

Researchers in computational studies have been interested in collocation studies in a certain environment in which the items composing collocations occur.

The aim of the study on collocations by Sinclair (1966) is to examine how strong the partnership of each constituent in a collocation is in terms of the perspective of their frequencies of co-occurrence in large quantities of text. Indeed, he believes that lexical study has a strong possibility to show strong and close relationships between items. However, there is a problem about how the close relationships of collocations should be measured. He suggests that the solution is to restrict the collocating items to a span of fixed constituents on either side of the specified main word (the node) whose patterning is being investigated.

Sinclair also gives useful definitions of some terms such as node, causal collocations, and significant collocations, which can be employed in text analysis. Regarding node, he defines it with two other terms a span and a collocate as follows:

#### Abstract

We may use the term node to refer to an item whose collocations we are studying and we may then define a span as the number of lexical items on each side of a node that we consider relevant to that node. Items in the environment set by the span we will call collocates. (Sinclair, 1966, p. 414)

The definition of these terms is later cited by some descriptive researchers
(e.g. Carter 1987) and lexicographers (e.g. Kjellmer 1994) in defining collocations.

Casual collocations and significant collocations are two groups into which Sinclair (1966) divides collocations. They can be distinguished by considering the frequency of repetition of the items which are under investigation. He refers to casual collocation as lexis which is most unlikely to have any predictive power over the node and which occurs accidentally, while significant collocation is what has a strong tendency to occur near the node. However long a chosen text is, any discrepancy between the predicted and the actual figures can be solved by statistical tests, giving a positive correlation, negative correlation or an absence of correlation.

The paper by Berry-Rogghe (1973) consists of two parts: an explanation of corpus study on collocation and the results of his pilot study. In the former part, he points out a disadvantage of Firth's explanation of collocations, namely the rather unclear notion of terms which he described. In order to overcome that shortcoming, he clarifies some key terms of collocation study such as collocate and node as well as explains corpus study on collocation. As a technically more helpful definition of collocation, he cites Halliday's definition of collocation (1961) that "syntagmatic association of lexical items, quantifiable, textually, as the probability that there will occur at $n$ removes (a distance of $n$ lexical items) from an item $x$, the item $a, b, c . . . "(c i t e d ~ i n ~$ Berry-Rogghe, 1973, p. 103). He also introduces the aim of collocation study with several key terms: "the aim is to compile a list of those syntagmatic items (collocates) significantly co-occurring with a given lexical item (node) within a specified linear distance (span)" (1973, p. 103). As for span, he concludes that adopting a span of four is appropriate for any type of data and
for all nodes which are non-grammatical items, except in the case of adjectives where a span of only two seems indicated (1973, p. 108).

Considering the procedure of statistical data, he describes two steps (1973, p. 105). The first step is computing the probability of B co-occurring with A certain times, if B were randomly distributed in the text. The next step is evaluating the difference between the expected number of co-occurrences and the observed number of co-occurrences. In this case, the $z$-score is an effective statistical measure to decide whether the difference between observed and expected frequencies is significant or not.

Based on these ideas, in his second part, Berry-Rogghe conducted a pilot study whose aim was to attempt to make explicit the notion of collocation in statistical and computational terms and answer some methodological questions such as "What is the optimal span size?" and "Should grammatical items be ignored?" In order to conduct this study, 71,595 items were used as running words, all of which were derived from three works: one was a $19^{\text {th }}$ prose work and two were modern plays. The texts were processed on the Atlas computers at Manchester and Chilton.

His results indicated that common items such as house most frequently collocated with grammatical items: the or this and the verb: sell. Regarding the optimal span size, further prose work, increasing the span size from three to six, had both a positive and a negative effect. He explained that it might be because of the difference between the mean sentence length, which amounted to 14.03 in the prose and 6.7 in the modern plays. Thus, as a first attempt to display the statistical analysis that can be used and making the terms used in the text analysis clear, Berry-Rogghe's study was a breakthrough in those days, although the size of the corpus was very small.

Finally, he anticipated the next stage in computational study of collocation and stated: "The eventual aim of a collocational analysis is not just to establish sets of syntagmatically related items but to extend these to include paradigmatically related items so that eventually a 'semantic field' might be established" (1973, p. 111).

Jones and Sinclair (1974) conducted their study in text analysis. The hypothesis under examination in this study is whether lexis is an independent organizing principle in natural language. In other words, the main concern of this study is to find evidence of lexical rather than grammatical organization of the natural language. Before they started their study, they define several key factors in computational study: lexical item, node and collocate, collocation, and span. First, they define a lexical item as "a unit of language representing a particular area of meaning which has a unique pattern of co-occurrence with other lexical items" (1974, p. 16). They are contrasted with the term, grammatical item (e.g. the and and) which a unit of language whose presence in the text is affected by a grammatical function, not lexis. Second, node is defined as an item whose pattern of occurring with other words is examined and collocate as any item which is likely to occur with the node in a certain environment (1974, p. 16). We know that they are items named for convenience sake and there is no difference between them. Third, collocation is the co-occurrence of two items in a text within a certain environment and frequency is a main factor to identify collocations in computational study. Fourth, span is defined by "specifying a standard number of orthographic words, disregarding the grammatical structures of which they form a part" (1974, p. 21). Conventionally, span positions of collocates are fixed according to different studies. In their study,
positions $N-4$ to $N+4$ are regarded as appropriate.
After clearly defining these key words, they prepared 135,000 spoken-word corpus extracted from 30 speakers' conversations at the Universities of Edinburgh and London. They were all recorded and transcribed. The conversations consisted of an average output of eight to 10 thousand words per hour and covered various kinds of topics. Jones and Sinclair examined this corpus to provide precise definitions for the concepts lexical item and significant collocation. They also compared the behavior of certain articles, deictics, pronouns, and prepositions with more fully lexical items to distinguish grammatical from lexical patterns of collocation.

There were several findings obtained from their analysis. There were much more collocates which were position-dependent collocations than position free collocations. In other words, position-dependence is an important element in collocational behavior. The position-dependent collocations are characteristic of grammatical items such as pronouns and prepositions, the position of high frequency grammatical words can be easily predicted and the power is limited to the ability to attract particular word classes at particular span positions. Furthermore, personal pronouns and prepositions as nodes co-occurred significantly with grammatical items such as prepositions and pronouns. In contrast, verbs showed a tendency to collocate with grammatical items (e.g. prepositions) to form phrasal verbs. The tendency between lexical items collocating with each other was that adverbs preceded adjectives and nouns followed them. Moreover, the significance of a collocation depends on the overall frequency of the items concerned, the number of times they occur together, and the length of text. Finally, collocation is regarded as an important organizing principle that
exercises an influence on the construction and interpretation of utterances. The conclusion reached by Jones and Sinclair was that the data provided evidence of lexical organization.

In Sinclair's continued computational studies in lexis, he explains the way in which meaning arises from language text in two different principles: the open choice principle and the idiom principle (1987, 1991). The first principle, the open choice principle is a way of seeing text as a result of a very large number of complex open choices and restricted grammars. This principle is a normal way of seeing and describing language and deals with progressive choices of any words which satisfy the restraint of grammaticalness (1987, pp. 319-320). The other principle, the idiom principle, is a way of seeing text in which words do not occur randomly and the open choice principle has no effect. According to this principle, " a language user has available to him or her a large number of semi-preconstructed phrases that constitute a single choice even though they might appear to be analyzable into segments" (1987, p. 320). Sinclair suggests that the first mode to be applied to normal texts by language users is the idiom principle as it enables them to interpret most of the texts. This nature of the idiom principle has been widely used as a justification for the study of chunks, according to Nation (2001, p. 324).

Based on these two frameworks, Sinclair considers the role of collocation. He defines collocation as word combinations which illustrate the idiom principle and appear to be chosen in pairs or groups, not necessarily adjacent. In the determination of items collocating with each other in this model, he regards frequency as the only criterion and it is also the determiner of the importance of an item in relation to its collocates as follows (1987):

#### Abstract

When two words of different frequencies collocate significantly, the collocation has a different value in the description of each of the two words. If word A is twice as frequent as word B, then each time they occur together has twice the importance for B than it does for A . This is because that particular event accounts for twice the proportion of B than of A. (p. 325)

Based on this key concept, frequency, he focuses on only the lexical co-occurrence of words which is a major source of difficulty for learners of English and edits the Collins COBUILD English Collocations on CD-ROM in reference to data extracted from the Birmingham-based Bank of English (see Lexicographic Studies).

Kjellmer (1984), whose interest is both computational study and lexicographic study, focuses on a discussion of the distinctiveness of collocation and how it could be measured. His perspective that we do not only necessarily depend on frequency in collocation studies is found in his mention that "if frequency alone were to be our guide in extracting collocational material from the corpus, it is clear that that material would be of a very heterogeneous nature" (1982, p. 25). He defines collocation as "lexically determined and grammatically restricted sequences of words" (1983, p. 163). Lexically determined means that in order to be considered as a collocation, a word sequence should recur a certain number of times in the corpus. Grammatically restricted means that the sequence should also be grammatically well formed. Based on these criteria, try to, hall to and green ideas all occur in the corpus, but only try to is regarded as a collocation, because green ideas occurs only in the Brown Corpus and hall to is not a grammatically well-formed sequence. Thus, the joint application of these two
conditions is necessary to specify collocation, against Sinclair (1987) who argues that frequency is the only criterion to determine collocations.

The distinctiveness of collocations, which is one quality of collocations, is a matter of degree rather than an all-or-nothing feature. Kjellmer (1984, pp. 165-171) suggests that the following six criteria should be used to measure the degree of collocational distinctiveness.
(a) Absolute frequency of occurrence. The more frequent the collocation is, the more distinctive it is likely to be. This criterion has been used by many authors.
(b) Relative frequency of occurrence. The more frequent a sequence is in relation to its expected frequency of occurrence, the more distinctive it is likely to be. The combinations that do occur will mostly occur more frequently than we have reason to expect them to on solely statistical grounds.
(c) Length of sequence. The longer a recurring sequence is, the more distinctive it is likely to be. For example, the collocation figured prominently in seems more distinctive than figure in. This sequence length is incorporated into the cost criterion of Kita et al. (1994).
(d) Distribution of the sequence over texts. The more texts a sequence is distributed over, the more distinctive it is likely to be. This criterion may be evaluated using the measures of diversity.
(e) Distribution of sequence over text categories. The more text categories a sequence is distributed over, the more distinctive it is likely to be. High frequency in several texts within one text category may denote technical language, special jargon, and the like.
(f) Structure of sequence. The more structurally complex a sequence is, the more distinctive it is likely to be.

Kjellmer (1987, p. 133) is also interested in the distribution of collocations among different text types and examined the nature of English collocations occurring in the Brown Corpus, which comprises one million words taken from American English texts since 1961 (1994, p. x). There are mainly three findings from this data analysis. First, collocations are necessary and commonly appearing elements of any English text. Second, collocations occur in an informative text rather than in an imaginative text. Finally, long collocations, which consist of five words or more (e.g. in the field of higher education), occur in the more formal genres of the Brown corpus which aim to communicate successfully rather than to be creative.

In his later study, Kjellmer (1990) analyzes the Brown corpus and the Gothenburg corpus, a sub-corpus of Brown, to answer the following two questions: "Are some types of words more likely than others to occur in collocations?" and "Is it possible to find a common denominator in collocational tag-classes?" The main finding is that words differ very markedly in their tendency to cluster. Singular nouns and the base form of verbs are highly collocational while adjectives and adverbs are not. Predominately, some functional or contextual restriction of the type is a key factor which decides whether a type of word shows this tendency to cluster.

Smadja's (1993) main concern is the automatic acquisition of collocations which have particular statistical distributions. He developed a statistical tool, XTRACT, which retrieves and identifies collocations from large textual corpora. In his introduction (p. 399), he explains two kinds of collocations:
flexible collocations in which the words can be inflected, the word order may vary and the words can be separated by an arbitrary number of other words; and compound collocations which involve two or more words used in a very rigid way. These collocations have two basic points. One is that collocations are extensive and in the story every sentence contains at least one collocation. The other is that collocations are idiomatic constructs, which are difficult to predict and thus necessitate specific lexical knowledge. This latter point causes a major problem for learners as well as for various machine applications such as language generation or machine translation.

To retrieve and identify such problematic collocations from corpora, $X T R A C T$ works in the following three stages. The first is a data gathering and result analyzing stage to produce statistical lexical information and to analyze this information to retrieve paired collocations involved in a syntactic relation in texts by a statistical technique. The second is producing collocations involving more than two words ( n -word collocations) in a much simpler way than other related methods. These collocations can involve closed class words (e.g. particles and prepositions). To do this, XTRACT examines all the sentences which contain them in order to analyze the distributions of words and parts of speech in the surrounding positions. The application stage is final, in which parsing and statistical methodologies are combined to identify the proper syntactic relation between the two words. A secondary effect of the third stage is to refine plenty of candidate collocations as irrelevant and thus produce higher quality output. He concludes that in this way, higher quality collocations can be obtained and even if the number and size of available textual corpora are rapidly growing, it would be useful to assist in implementing natural language processing as well as to help
lexicographers compile corpus-based dictionaries.
In his later study, Smadja, McKeown and Hatzinvassiloglou (1996), he develops a software program, Champollion, for translating collocations. This Champollion enables us to automatically produce the translations, with a pair of parallel corpora in two different languages and a list of collocations in one of them. This statistical tool is designed to be applied to compile bilingual lexical information for different domains. They write that providing translations for collocations is a worthwhile attempting because collocations are opaque constructions and domain dependent, and the correspondences between collocations in two languages are still unexplored. They try to compile translations for the domain-specific collocations by applying Champollion to a corpus in a new domain.

The result of testing Champollion on three separate years of the Hansards Corpus yielded the French translations of 300 collocations, 73\% accuracy on average can be obtained with the best case, $78 \%$. This result is fairly good, compared with that of other full machine translation systems.

Like Smadja (1993), Biber (1993) is also interested in the development of a software tool to extract collocations automatically. He presents the use of factor analysis as a tool for the automatic extraction of collocations. Factor analysis aims at identifying groupings of collocations from the input data, which is information computed over the domain of the individual text. It follows the next three steps (Biber, 1993, pp. 532-533): (a) identifying the major collocational patterns for some target words, (b) counting the frequency of each collocation pair in each text of the corpus and (c) identifying the groupings of collocational pairs that tended to co-occur in the text.

The two pilot analyses in which Biber exemplified the use of factor analysis with the words certain and right showed that it was very useful as a tool for the automatic identification of the main word senses and uses, and that it could also help in compiling dictionaries.

Renouf and Sinclair (1991), and Noel (1992) are interested in collocations from their own angles, which are different from Sinclair (1966) and Berry-Rogghe (1973). Renouf and Sinclair (1991, p. 128) have investigated collocations using certain frameworks, which consist of a discontinuous sequence of two high-frequency grammatical words positioned at a one word span from each other. The reason why they focused on grammatical words is that combinations of grammatical words occur more often than those of lexical words: therefore, it would appear justifiable to examine their patterning in terms of the phenomenon. In order to analyze the Birmingham Collection of English Text, which consists of a spoken British English text and a written British English text, Renouf and Sinclair chose seven frameworks which were made up of different pairings of high-frequency grammatical words: $a+$ ?+of, $a n+?+o f, b e+?+t o$, too + ?+to, for + ?+of, $h a d+?+o f$ and many+?+of. The result of this study indicated that the frameworks were highly selective of their collocations and the different frameworks had different degrees of productivity (1991, p. 130). They also pointed out that the choice of word class and collocation was governed by constituents in the framework and that a high type-token ratio could be a clear indication that the frameworks were statistically significant (1991, p. 143).

Noel (1992) is concerned with the investigation of collocation in bilingual texts and corpora, especially in the context of theoretical studies on translation and machine translation. His aim is to improve a computerized
procedure for compiling bilingual dictionaries for French speakers of English based on collocation data from Buro voor Systeemontwikkeling, correcting some of the disadvantages of most existing monolingual dictionaries. He took three steps in completing the compilation of bilingual texts for collocations: (a) transforming bilingual test into parallel text, (b) identifying English collocations and (c) searching bilingual texts for collocations.

In summary, researchers in computational studies rely on computer technology and statistics to objectively study collocations in a certain environment in which the items composing collocations occur. They have used computer techniques to measure the distinctiveness of collocation, extract collocation automatically, develop specific programs and techniques of analysis to do further collocation studies and create corpus-based dictionaries. They have been developed on the basis of the definition and concept of collocation and some technical terms such as norm and collocate by Sinclair (1966) and Berry-Rogghe (1973).

Frequency, which is regarded as an absolute criterion in the computational domain, has exerted an great influence on collocation study in other study domains because new objective facts about English collocations, i.e. how collocations are actually used can be shown without relying on native speakers' intuition. However, some researchers such as Gavioli \& Aston (2003) and Kjellmer (1984) point out that we should not rely much on frequency in collocation studies because it is one of the features which collocations contain and it is obtained in the corpora, which are too small to reflect the average adult user's experience of the language.

### 2.3.4. Lexicographic studies

This section discusses lexicographers' questions of collocations in a dictionary: Should collocations be regarded as separate dictionary entries? If so, which collocations and how many should be dealt with in the restricted space of a dictionary?

Modern general purpose dictionaries are giving more and more attention to collocation and contain many collocations in them. For example, the Oxford Advanced Learner's Dictionary (OALD sixth edition, 2000) contains 10,000 collocations while its fifth edition contains no more than 4,000 . Furthermore, it provides study pages in which the definition and the type of collocations are shown, and explains how to check collocations so that learners can understand collocations better. The Longman Dictionary of Contemporary English (LDOCE, 2001) presents collocations in the order frequency in reference to the frequency of collocations in the Longman Corpus Network and the Longman Spoken Language Corpus. The Collins COBUILD English Dictionary (COBUILD second edition, 1995) and the Cambridge International Dictionary of English (CIDE first edition, 1995) also present many collocations, which are emphasized in bold face.

However, a couple of important problems arise in such dictionaries in terms of the treatment of collocation - insufficient information on collocations and inconsistent presentation of collocations. As for the former, the Oxford Collocations Dictionary for Students of English (2002, p. viii) points out that as modern dictionaries have an inclination to be hindered by trying to cover as much information as possible about any word (registers, word patterns, grammatical information and so on) besides its collocations, collocational information is still not enough for learners. Regarding the
latter, Cowie (1981, pp. 223-224) criticizes the inconsistent presentation of collocations, exemplifying wage freeze as a main entry in the Longman Dictionary of Contemporary English (1978), while it is one of the examples at wage 1 in the $O A L D 3^{\text {rd }}$ edition (1974). He suggests that more collocations should be introduced in the general pedagogical dictionaries as lexicographers take into account the learner's use of dictionaries with a reference purpose in the decoding process in spite of the limited space of dictionaries. In order to overcome these problems, some dictionaries have been compiled, especially focusing on collocations.

The interest of Mackin (1978) is what kind of collocations should be included in a dictionary. He suggests that collocations should be placed on a scale of probability (1978, p. 164) and that three main sources should be used in compiling a collocation dictionary: (a) other dictionaries, (b) the lexicographer's competence, and (c) occurrences which are met in spoken and written English such as newspapers and radio and television conversations. All of them are used in compiling the Oxford Dictionary of Current Idiomatic English (ODCIE).

In the ODCIE, Cowie, Mackin and McCaig (1983) present a wide range of collocations. The dictionary has a consistent classificatory system in which both the external relationship between collocations and grammatical patterns and the internal arrangement, such as belonging to different word classes, different subclasses of noun (e.g. common, abstract, proper) etc., of lists of collocates are made clear by using some abbreviations and symbols in the entries (1983, pp. xliii-xlix). The dictionary presents open sets, to which other words can be added by the user, and restricted sets, which include all the possibilities of choice of collocates, and it marks the latter form with a
special symbol (1983, pp. xiv-xv). In spite of the fact that this dictionary covers a wide range of collocations, the name of the dictionary is confusing. Learners might not use the dictionary to look up a collocation unless they know it explains collocations as well as idioms used in current English.

Mackin (1978) also mentions collocation studies from the pedagogical point of view. He claims that whether an association of words belongs to collocations or not is based on native speakers' intuition. Therefore, second or foreign language learners have no way in which they can produce new acceptable combinations of words, let alone be taught all the collocations, because "collocations are in any case so numerous as to rule out any methodical teaching or acquisition of them" (1978, p. 151). His suggestion is that learners can acquire some degree of collocational competence in "years of study, reading and observation of the language" (1978: 151-152) and that dictionaries should play an important role in order to support learners.

Cowie (1978) focuses on collocations in editing a learner's dictionary. He discusses the treatment of collocations in dictionaries by giving some examples (e.g. block all roads/lanes/alleys/streets and check a bill/sb's statements/these figures.) from the ODCIE vol. 1.

First, he defines collocation as "the co-occurrence of two or more lexical items as realizations of structural elements within a given syntactic pattern" (1978, p. 132) and second, he emphasizes the importance of the range of words in order to distinguish open combinations and restricted combinations. He claims that openness and restrictedness of co-occurrence of words are related to the range of other items with which they can combine and can be represented as "the end-points of a scale or continuum; various major types of collocation can be identified, and can conveniently be related to parts of
this scale" (1978, p. 133). He also mentions that restricted collocations, especially idiomatic collocations, are difficult for second or foreign language learners to acquire, because of the unique and opaque meaning created by combining constituents of words.

Finally, Cowie discusses the lexicographic view, which is his most interesting point: how to present lexical patterns in a learner's dictionary. He makes four important recommendations (1978, pp. 135-136) as described below:

1. Lexicographers who want to display collocational potential from example sentences can do so in three possible ways. One is by expressing words with semantic features. For example, father, foreman and officer have the same semantic features: [+human, +male, +adult, +authority]. The second is by specifying one general word: superior can be related to terms, boss, leader and patron. The final way, which he thinks is the most effective, is by "listing a judicious selection of such particular items as representative (and suggestive) of the total range of choice" (1978, p. 135). The reason why he recommends the last way is that it can reduce learners' burden in learning language by presenting them with a sub-set of particular items.
2. If the collocational range of a headword includes nouns which have different semantic sub-classes, it should be mentioned to learners explicitly by using a semicolon to make clear the words' special possibilities and restrictions of co-occurrence.
3. Some possible combinations with items many native speakers tend to choose should be displayed in dictionaries. For example, voice and accent collocate with put on; however, it, act, airs are higher choices to be combined with these words. The simplest way of indicating such preferences is to put them first in entry of headwords.
4. A small set of items which collocates with another in a specialized sense should be highlighted by using a special sign.

Cowie's concern is the study of collocations not only in dictionaries but also in journalistic prose. Cowie (1992) examines the use of the multiword lexical units in newspaper writing: "Gorbachev's new revolution" from Mary Dejewsky and The Times on June 29 th 1988. His study provides evidence that in newspaper articles the number of creative word combinations and idioms tends to be very small, while verb-noun restricted collocations which are already well-established and widely known are extensively used. As a pedagogical implication, Cowie argues that as restricted collocations play an important role in text, they should be intensively taught to learners of English.

A more synthetic definition of collocations has been provided by Benson et al. (1997), comparing them with free combinations and idioms, all of which belong to lexical combinations. They claim that these three groups exhibit various degrees of cohesiveness, on the basis of which they can be distinguished and explain the difference by using an example, commit murder (1997, p. xxx). Commit murder is not an idiom, because the meaning of the whole reflects the meaning of the constituents and commit is limited in
use to a few nouns, meaning crime and wrongdoing ${ }^{3}$. Moreover, this word combination is also different from free combinations in two ways. First, perpetrate seems to be the only synonym of the verb which can replace commit. Second, and more importantly, the combination commit murder is used more frequently. The points they regard as important in defining collocations are frequency, the range of each word, and collocational restriction with other words by comparison of two other combinations.

Based on the above definition of collocation, Benson et al. (1997) divide collocations into two categories: grammatical collocations and lexical collocations. The former consists of a dominant word such as noun, adjective, and verb and a preposition or a grammatical construction. The latter, on the other hand, does not contain any preposition or grammatical construction. Each categorization has been divided into sub-categorization as follows (1997, pp. xv-xxxiii):

Table 6. Grammatical collocations by Benson et al. (1997, pp. xv-xxxiii)

|  | Combination | Example |
| :--- | :--- | :--- |
| G1 | noun + preposition | blockade against, apathy towards |
| G2 | noun + to infinitive | It was a pleasure to do it. |
| G3 | noun + that clause | He took an oath that he would do his duty. |
| G4 | preposition + noun | by accident, in advance |
| G5 | adjective + preposition | be angry at, be fond of |
| G6 | predicate adjective + to infinitive | It was necessary to work. |
| G7 | adjective + that clause | It was nice that he was able to come home for the <br> holidays. |
| G8 | consists of 19 English verbs | send (the dative movement transformation verb) |

[^2]Table 7. Lexical collocations by Benson et al. (1997, pp. xv-xxxiii)

|  | Combination | Example |
| :--- | :--- | :--- |
| L1 | verb + noun | compose music, wind a watch |
| L2 | verb + noun (eradication and/or <br> nullification and a noun) | reject an appeal, reverse a decision |
| L3 | adjective + noun | strong tea, a sweeping generalization |
| L4 | noun + verb | bees buzz, bombs explode |
| L5 | noun + noun | a bit of advice, a pack of dogs |
| L6 | adverb + adjective | deeply absorbed, strictly accurate |
| L7 | verb + adverb | affect deeply, amuse thoroughly |

From the pedagogical point of view, they emphasize the importance of the collocation acquisition in order for second or foreign language learners to achieve active mastery of English.

Although Benson et al.'s definition of collocations is more synthetic than previous researchers', Gramley and Pätzold (1992, pp. 64-65) point out that boundary between collocations and free combinations is not clear in the $B B I$ Dictionary of English Word Combinations. Their critique is that while in the introduction of the dictionary it is mentioned that free lexical combinations are excluded, free combinations such as combinations of woman and common adjectives fat, old, short and tall are listed. Thus, Benson et al.'s distinction between collocations and free combinations is vague and therefore Gramley and Pätzold suggest that empirical research based on corpora is necessary to make the boundary clear.

Hill and Lewis (1999) have compiled the Dictionary of Selected Collocations (DOSC) based on Lexical Approach (1993) advocated by them (see the following section). They argue in the approach that as a chunk, especially collocation, is a central component in language, learners should try to develop their larger mental lexicon by paying attention to collocations from the early stages. To promote their Lexical Approach, they select
collocations based on the frequency of the combinations, which is one of the important features for collocations (1999, p. 7).

The main interesting feature of the $D O S C$ is that in compiling this dictionary, collocations are selected for intermediate or advanced learners who have had some degree of prior semantic knowledge about collocations to enable them to write, translate or speak English by using the words they have already known. On its cover, the DOSC states that it offers 55,000 collocations under 3,200 essential headwords to help learners make more natural, and hence better, use of words already partially known. Excluded are those collocations which, they write, are too common, too technical, too colloquial, or too difficult for learners to use; it includes those which have a strong relation, the strength of judgment resting on their expertise and their native speaker intuition.

Since the middle of the 1990s computer-assisted collocation dictionaries such as A Dictionary of English Collocations, Collins COBUILD English Collocations on CD-ROM (1995) and Oxford Collocations Dictionary for Students of English (2002) have been published.

Kjellmer (1994) has compiled a collocational dictionary: A Dictionary of English Collocations by using the Brown Corpus, which consists of one million words taken from representative samples of writings published in 1961 (1994, p. x). His work is based on two criteria for collocations, which he defines as "such recurring sequences of items as are grammatically well formed" (1994, p. xiv). One criterion is frequency of co-occurrence of certain words and the other is categorization of collocations. The former criterion is whether a sequence of two or more words has to co-occur more than once in the corpus in order to be accepted as a collocation. In discussing this, he
makes the comment that the co-occurrence of words varies in both spoken and written English, and high frequency word combinations should be listed in the dictionary. The latter criterion is that collocations should belong to one of 19 categories taken from Allen et al. (1975, cited in Kjellmer 1994, p.xxii) on a Swedish corpus, but the 19 categories are not divided into two groups, lexical collocations and grammatical collocations like Benson et al. (1997). The 19 categorization of collocations is shown in Table 8 (1994, pp. xxiii-xxix).

Table 8. 19 categorization of collocations by Kjellmer (1994, pp. xxiii-xxix)

|  | Combination | Example |
| :--- | :--- | :--- |
| 1 | noun phrase | the big question, evening service |
| 2 | nominal head + a related structure word | way out, day off |
| 3 | verb + object | loved him, receive attention |
| 4 | verb + related structure word(s) | partakes of, paid for by |
| 5 | verb + verb(s) | will come, let go |
| 6 | to + infinitive | to be, to examine |
| 7 | verb + its predicate | was cold, made better |
| 8 | adverbial + subordinating conjunction | very young, extremely well |
| 9 | adverb + subordinating conjunction | now that, even though |
| 10 | conjunction + adverb | or else, and yet |
| 11 | preposition + subordinating conjunction | except that, in that |
| 12 | adverb or preposition + preposition | out from, from under |
| 13 | full finite clause optionally followed by related <br> structure word | he said, when he was shot |
| 14 | it- or there- construction + related structure word | it is impossible to, it was obvious that |
| 15 | noun-finite or verbless clause | hands off, back straight |
| 16 | as or like + NP or adverb | as always, like myself |
| 17 | interjections, exclamations, vocativistic expressions | hey there, well now |
| 18 | co-ordinated elements | openly and honestly, actual or potential |
| 19 | non-English expressions | status quo, ad infinitum |

Such a classification scheme used in A Dictionary of English Collocations (1994) as well as the BBI Dictionary of English Word Combinations (1997)
might be useful for reference purposes, but it seems to reduce vocabulary items and grammatical structures occurring in the natural language to collocations, according to Elyildirm (1997, p. 40). He is afraid that classifying collocations into some categories distorts natural language as if it were composed only of units of collocations, because there is no evidence showing that "native speakers of English completely rely on collocations in language production" (p. 40).

The Collins COBUILD English Collocations on CD-ROM (1995) is an electric collocation dictionary containing about 140,000 node/collocate pairs and 2.6 million different examples. They are all taken from the Bank of English, which consists of 320 million spoken and written British English (about 70\%), American English (about 25\%) and other native varieties of English (about 5\%) from various sources such as newspapers, magazines, and radio broadcasts. The node of collocations was selected by computer based on the frequency and distribution in the Bank of English, omitting too technical terms, and the examples of combinations were selected at random from the Bank of English. Therefore, some unusual examples are found in it.

This electric dictionary can be easily accessed to check occurrences of high-frequency collocations, but the problem is that only 20 examples of combinations can be seen. In other words, only high-frequency collocations can be accessed, and low-frequency collocations cannot be seen. Thus, the presentation of collocations in the Collins COBUILD English Collocations on $C D-R O M$ is very limited.

The Oxford Collocations Dictionary for Students of English (2002) is also a corpus-based collocation dictionary in which 150,000 collocations of 9,000 headwords (nouns), verbs and adjectives and over 50,000 examples of the
collocations in context that occurred in the about 100 million word British National Corpus (BNC) are provided (see section 5.3.1.). The compilers define collocations as "the way words combine in a language to produce natural-sounding speech and writing." They consider medium-strong collocations (e.g. see a doctor, and direct equivalent) as more important than fairly weak collocations (e.g. see a film and an enjoyable holiday) and the strongest and most restricted collocations (e.g. see reason and burning ambition) (p. viii). They argue that medium-strong collocations are vital to communicative competence in English because they will make learners' speech and writing sound much more natural, even when basic intelligibility does not seem to be at issue. Therefore, medium-strong collocations are especially focused on for learners, although it covers the full range of collocations in this dictionary.

From the pedagogical point of view, learners aim to build up their own collocational competence on a need-to-know basis, starting from the words they already know (p. viii), because "choosing the right collocation will make his speech and writing sound much more natural, more native speaker-like, even when basic intelligibility does not seem to be at issue" (p. vii).

In lexicographic studies, researchers have been discussing some questions of collocations in a dictionary: Should collocations be regarded as separate dictionary entries? If so, which collocations and how many should be dealt with in the restricted space of a dictionary? General purpose English dictionaries have had a tendency to give as much collocational information as possible, but they have to provide other information such as grammatical information about the word. They also seem to have had no consensus on important collocations. In order to overcome the shortcomings of general
purpose dictionaries, collocation dictionaries including electric versions have been edited based on high-frequency collocations extracted from large corpora and development by computer technology.

### 2.3.5. Pedagogical studies

This section refers to researchers who advocate the necessity of the implementation of teaching collocations, apply Lexical Approach, and emphasize the more methodological way to teach collocations in the classroom-i.e., how should collocations be taught in the classroom?

Lewis (1993) and other linguists advocate Lexical Approach in which they focus on multi-word prefabricated chunks and better teaching methodology of them. It is completely different from the previous standard view that language consists of grammar (structure) and vocabulary (words), and stands by the new principle that language consists of chunks which produce continuous coherent text and store much of our mental lexicon.

Lexical Approach regards communication of meaning as the heart of language and language learning, which leads to an emphasis on vocabulary. The essential idea to support it is that fluency is based on the acquisition of a large store of prefabricated combinations, which are available as "foundation for any linguistic novelty or creativity" (Lewis, 1993, p. 15). Grammatical knowledge is also permitted as important, but it cannot begin to be helpful in that role until learners have a sufficiently large mental lexicon to which grammatical knowledge can be applied. Lexical Approach can be summarized as follows:

In Lexical Approach, more attention is paid to:

- Lexis - different kinds of multi-word chunks
- specific language areas not previously standard in many EFL texts
- listening (at lower levels) and reading (at higher levels)
- activities based on L1/L2 comparisons and translation
- the use of the dictionary as a resource for active learning
- probable rather than possible English
- organizing learners' notebooks to reveal patterns and aid retrieval
- the language which learners may meet outside the classroom
- preparing learners to get maximum benefit text

In Lexical Approach, less attention is paid to:

- sentence grammar - single sentence gap-fill and transformation practices
- uncollocated nouns
- indiscriminate recording of new words
- talking in L2 just for the sake of it to claim to use a communicative approach
(Lewis, 2002, p. 15)

Chunks consist of single words while all the others are multi-word items: collocations, fixed expressions and semi-fixed expressions, but the centrality is collocation. He defines collocation as combinations of words which occur naturally in the used language, rather than combinations which ought to exist (p.26). Frequency is one of the norms to define collocations, but it alone does not reveal quality. It is because low-frequency collocations may be strong collocations and high-frequency collocations may be loosely bound. First priority should be strong and frequent collocations, subordinating loosely-bound and frequent collocations, as well as strong and low-frequent collocations. The last priority should be loosely-bound and low-frequent collocations. Thus, he claims that not only frequency but strength which shows the degree of boundary between nodes and collocates should be taken into consideration.

As a pedagogical point of view, he points out the importance of the teachers' role to present important collocations in the classroom in the
following two ways. First, teachers, using Lexical Approach, instead of analyzing language whenever possible, should be more ready to direct learners' attention to chunks which are as large as possible. Words do not normally exist alone and it makes sense to learn them in a strong, frequent and typical pattern of actual use. Second, it is more efficient to learn the whole and break it into parts than to learn the whole as an extra arbitrary item. In this way, raising learners' awareness of collocations and encouraging them to explore them is a very efficient way to facilitate learners to make better use of language they have already known at a word level.

As for the suggestion that learners' attention should be consciously drawn to collocations in order to develop their lexicon, Lewis (2002) proposes that first, learners should take in large quantities of listening which is largely comprehensible and then, take in similar quantities of comprehensive reading. Thus, he confidently advocates learners' listening and reading as much as possible to make learners develop their lexicons. In the process, helpful effects from L1 can be made best use of, because in Lexical Approach the effects of L1 are both helpful and unhelpful, so negative transfer should be avoided and positive transfer should be made good use of for learners' acquisition.

In order to convert his pedagogical suggestions to concrete practice, a vocabulary notebook and collocation exercises are proposed by Lewis as useful learning aids for learners. This is because whenever learners encounter new words and known words again, they should be recorded and activated with high-frequency and strong collocates together, in order to keep them in long-term memory. Collocation boxes and collocation cascades
are exemplified. First, collocation boxes are very productive to record collocations occurring by theme, chapter, unit and so on. The following is a concrete example:

| five verbs | + noun |
| :---: | :---: |
| dismiss |  |
| express |  |
| meet | objection |
| raise |  |
| withdraw |  |

The point is that (a) not a long list but five collocates with the head is probably best, (b) collocates should be strong and frequent, (c) collocates should be new as partners of the headword, even though learners perhaps knew the individual words before, and (d) collocates should be useful to the individual learner's specific needs and interests (Lewis, 2003, p. 80).

The second proposal by Lewis (2002) is a collocation cascade. It is useful in building collocations systematically in a specialized area. The best sequence is usually key noun and collocating verb and learners will move from collocate to collocate. Formats need to be either preprinted or drawn by learners and the sequential collocates can induce learners' collocational acquisition. The concrete example is as follows:

Considering collocation exercises, identifying chunks, matching parts of collocations, completing the missing pair of words, categorizing and sequencing collocations, and deleting improper pairs are introduced. Teachers should carefully select different types of exercises to meet various learner levels, time used in the class and so on.

Woolard (2000), one of the advocates of Lexical Approach, defines collocations as "words which are statistically much more likely to appear together than random chance suggests" (p. 29). From the pedagogical point of view, he proposes that the term, collocation, should be used to relations between content words only, because it provides a very clear definition for his students.

He recommends his students to record collocations based on the definition mentioned above on their notebook as well as does Lewis (2002) in order to recognize them, encounter them subsequently, and rehearse them productively. His proposed format includes not only headwords, collocates, examples but also word grammar which should be learned with key words unlike traditional grammar teaching. This is because his learners face difficulty using prepositions in producing sentences with key collocations. He claims that it is more useful and that subsequent encounters would obviously enrich students' knowledge of collocations with the prepositional patterns. An example of the format for a learner's notebook entry is at the top of the next page.

He mentions that in the notebook a little extra space should be prepared to add extra information and revise it in the light of the learners' increased exposure to the language and collocation dictionaries.

```
CRITICISM
(pronunciation + translation)
to express disapproval of something or somebody
The government has received a lot of criticism for increasing taxes.
V: receive, come in for...
A: heavy, severe, fierce...
G: ...criticism for raising taxes
    ...criticism for its plan (to build...)
    ...criticism over the decision (to spend...)
F: ...come under heavy criticism for not providing...
    The same criticism has been leveled at...
```

(Woolard, 2000, p. 45)

Conzett (2000) claims that collocations whose items appear in the middle of a continuum from strong to weak in conceptualizing collocations should be targeted, and offers several teaching suggestions and testing exercises. The first suggestion is to let students be aware of the concept, collocation, and have them consciously learn many collocations. The second is to select books that include many collocations. She proposes to check teacher intuition by corpus-based references so that they will feel confident in supplying high-frequency collocations. The third is to present collocations in certain contexts. The fourth is to add questions from time to time during the class to fix learning collocations in the learners' memories. The fifth is to select vocabulary textbooks according to the learners' specific purposes. She adds collocation grids and completing collocation tasks as effective ways to review and practice, which is crucial to retention. This is based on previous research that learners need to encounter a new word five times to seven times to keep it in their memory (Crothers \& Suppers, 1967; Kachroo, 1962; Rod, 1999; Salling, 1959). The sixth is to train learners to observe and note as many collocations as possible through reading and gradually shift their activity from reading to writing by reinforcing them in writing assignments.

After these suggestions, she introduces some testing exercises to help learners retain the memory of the collocations such as collocation grid, additions to tests for vocabulary-builder textbooks, backwards vocabulary tests, producing example sentences, and collocations dominoes. As for additions to test for vocabulary-builder textbooks, she points out that different collocation tests should be prepared according to different purposes. For example, matching columns of collocations is appropriate for all levels, while more active tasks, productive collocational tests such as asking learners to supply collocations are appropriate to stimulate learners' collocational knowledge. Backwards vocabulary tests are valuable in helping learners retain their reading vocabulary. A list of collocations can be collected for different thematic or content-based units in a reading class and learners should answer the proper collocations for a set of definitions prepared by teachers. Collocation dominoes are a very enjoyable task, in which teams or pairs of learners are given sets of cards, each of which contains one part of a useful collocation and they match the two parts. Learners will enjoy this game-like activity without any stress.

Hill (2000), who is an editor of the DOSC with Lewis, recommends exploiting a text and using a collocation dictionary to record collocations in learners' notebooks and preparing their essays with Morgan Lewis and Michael Lewis as well, but he contributes to the clarification of reasons why collocations are important from a pedagogical point of view in a large part of his paper. The following nine are important for teachers: (a) non-arbitrary lexicon, (b) predictability, (c) size of the phrasal mental lexicon, (d) role of memory, (e) fluency, (f) complex ideas with lexical expressions, (g) making thinking easier, (h) integral pronunciation, and (i) recognizing chunks for
acquisition. Some of them overlap with other Lexical Approach advocates, but he especially emphasizes collocations in terms of the role of memory. He points out that chunks make up a huge percentage of all naturally-occurring texts, spoken or written in our mental lexicon, which proves to be much larger than previously thought and in fact, native speakers have a large store of these chunks in their minds that they are ready to use when required. In order to develop their mental lexicon that covers a large percentage of prefabricated expressions, learners should build up their memory and be exposed to as many chunks as possible from naturally used texts from the earliest stages. And then, they will be ready to produce examples fluently whenever required and make thinking and expressing easier with more chunks. In regard to the importance of collocational knowledge mentioned above, he highlighted the importance of the teachers' role to raise learners' attention to collocations in the classroom.

Hill also recommended that using chunking is a good way and deserves to be etched into all learner's memories as do other Lexical Approach advocates, but he highlights the fact that learners have heavy burden to bear, because the combination of words is tremendously enormous. To lessen their burden, Hoey (2000) makes three suggestions. The first is about collocation word lists which are useful for learners to build up for themselves. To do so, learners should create a set of concordancing software that enables them to expose themselves to as much naturally occurring language as they are capable of processing and find regularities and recurrent features from it. Moreover, if the learner has access to computer concordances, it would be much better, but even if not, any text would give him/her much collocational information. Second, it is semantic prosody which is defined as what occurs when a word
associates with a particular set of meaning. It is a kind of generalization based upon the collocates a word has. For example, if a learner wants to learn chilly, he/she would do best to learn that it occurs in certain kinds of context rather than all contexts, because chilly is more likely to be associated with unit of time than watery things or ill people. Thus, it is no longer necessary to learn as many collocations as possible and instead learn the word combination with an absolutely typical representatives of semantic prosody. Third, it is colligation which is defined as "the grammatical company a word keeps and the positions it prefers" (p. 234). While semantic prosody is closely associated with the meanings of words occurring in a certain context, colligation describes the appropriate position of words in its grammatical context. For example, words which belong to employment such as actor, architect and carpenter are all expected to take definite and indefinite articles, possessives, classifiers, and apposition, but they differ grammatically amongst themselves. The word carpenter is more likely to occur with a classifier (a wages accountant) than any other items.

After focusing on the three factors to lessen learners' burden in the acquisition of vocabulary, Hoey introduces two approaches to intensify the learner's encounters with words. The first one is to use a text to produce a manual concordance. A group of words which occurred commonly in the text are taken and they can be presented to learners as an activity in which they would go through the text looking for one or more of these key words and learn the combinations with the key words in the context. The other approach is to have students search for words that are combined together and look for other sentences with the same group of words in them. In this approach, learners will encounter word combinations several times in
different contexts and automatically recognize the semantic prosody and colligations of the words. The point of these approaches is that learners should learn the meaning of words in the different environments they occur in.

Hoey (2000), a descriptive linguist, did not introduce practical methodology such as recording collocations and giving activities on collocations, but he introduces a vocabulary textbook which offers the learner advice that is thought to be extremely sensible. That is English Vocabulary in Use (2 $2^{\text {nd }}$ ed.) by McCarthy and O'Dell (2001). This is the new edition which revised the first edition published in 1994 so that a number of new words and expressions might be brought into every day use by accessing the Cambridge International Corpus. Before vocabulary exercises, they devote the first of several pages to explain how to learn vocabulary, organize a vocabulary notebook such as word-map and word-table, use a dictionary effectively, revise vocabulary by making the new words active, reactivating words and expressions that learners had forgotten or they are not sure about, guess meaning in the context, and some terminologies learners need to know. In short, learners should have basic knowledge of vocabulary and a basic strategy of effective learning of vocabulary. In the section of vocabulary learning (pp. 4-7) they highlight the importance of learning not words, but chunks to learners as follows:

What does knowing a new word mean?

- It is not enough just to know the meaning (or meanings) of a word. You also need to know:
(a) which words it is usually associated with
(b) its grammatical characteristics
(c) how it is pronounced
(d) whether it is formal, informal or neutral
- Try to learn new words in phrases not in isolation
- Write down words that commonly go together. These are called collocations:

Adjectives + nouns, e.g. rich vocabulary, classical music, common sense.
Verbs + nouns, e.g. to express an opinion, to take sides.
Nouns in phrases, e.g. in touch with, a train set, a sense of humour
Words + prepositions, e.g. at a loss for words, thanks to you.

- Note special grammatical characteristics of new words. For example, note irregular verbs and uncountable nouns.
- Note any special pronunciation problems with new words
- Make a note if the word is particularly formal or informal in character, in other words if it has a particular register.
(McCarthy \& O'Dell, 2001, p. 5)

In this way, they first mention the importance of learning new words in chunks, by using the special term collocation for learners.

In summary, researchers in pedagogical studies are interested in practical and educational aspect of collocation acquisition based on Lexical Approach that collocation is a central component in language. They argue that it is quite important to seek pedagogically effective practice to broaden learners' collocational knowledge from the early stages. Therefore, many ways of supporting learners are recommended, organizing their notebooks containing many collocations and preparing activities, reviews and exercises on collocations.

### 2.4. Importance of collocation

The importance of collocation is advocated by many linguists and researchers, as mentioned in each study in 2.3. This section briefly summarizes collocations in terms of the following three points, in reference to Nation (2001, pp. 317-328) and Gitsaki (1999, pp. 26-30).

## 1. Language knowledge is collocational knowledge.

According to Ellis (2001), language knowledge and language use can be explained by the storage of chunks in long-term memory and the experience of how frequently chunks occur without the need to mention underlying rules. In other words, if not single words but chunks containing important words can be seen many times and they can be stored in long-term memory, language reception and language production are made more effective. This view is supported not only by Ellis (2001) but also by Lexical Approach proponents such as Lewis (1993, 2000) and Hill (2000). McCarthy (1984), Yorio (1980), Alexander (1984), Nattinger and DeCarrico (1992) and Korosadowicz-Struzynska (1980) also consider conventionalized language forms as important to develop learners' communicative competence. Ellis (2001) maintains that the direct instruction of collocations is important in language learning, but that most learning tends to take place through meaning-focused receptive and productive language use (Nation, 2001, p. 322)

## 2. All fluent and appropriate language use requires collocational

## knowledge.

According to Pawley and Syder (1983), the explanation of how language users produce native-like sentences and use the language fluently can be offered by the hypothesis that they store a number of lexicalized or institutionalized sentence stems which range on a scale from completely fixed expressions through collocations producing useful basic chunks in addition to knowing the rules of the language. Language users can choose an appropriate way to say things from a large range of possible preconstructed
clauses (native-like selection) and can produce the appropriate language fluently (with native-like fluency). In order to do so, all collocational sequences are important and need to be encountered many times (Nation 2001, p. 324). Hill (2000) also takes a similar stand with Pawley and Syder (1983).

## 3. Many words are used in a limited set of collocations and knowing

 these is part of what is involved in knowing the words.According to Sinclair (1991), the two models of how words occur in a text are described as the open-choice principle and idiom principle. While the open-choice principle is a model in which language text can be seen as a series of choices and only grammar limits choices, the idiom principle is a mode in which the choice of words and register are memorized as partly pre-constructed sequences. The latter is widely used as a justification for the study of chunks.

Nation (2001), Richards (1976), Palmberg (1986) and Miller (1999) have described that knowing a word involves knowing words it typically occurs with (collocations). Among them, Nation (2001) proposes systematic assumptions of knowing words, namely, collocation belongs to both receptive and productive knowledge in use.

## 4. Teaching phrase-patterns help learners' vocabulary expansion

According to Twaddell (1973), it is important to teach phrase-patterns from early stages of L2 learning to expand learners' vocabulary. He explains that vocabulary expansion will occur from the intermediate stages of L2 learning if "the most habitual parts of language use" such as phrase-patterns
and sentence patterns are "practiced and established as early as possible" (Twaddell, 1973, p. 63). In other words, new vocabulary can be adapted into the L2 patterns after the habits have been formed. Korosadowixz-Stuzynska (1980) has the same opinion as Twaddell (1973) and makes an additional comment on it. He claims that it is important to select collocations to be taught based on certain criteria (need, usefulness, productivity, currency, frequency and ease), present them in context and contrast them with the equivalent native-language collocations that might prevent learners from acquiring them smoothly (Korosadowixz-Stuzynska, 1980, pp. 116-117). Influence from L1 in acquiring collocations is examined by many researchers such as Bahns (1993) and Caroli (1998) (see Chapter 3).

As stated above, many researchers argue that collocations are important, supported by certain assumptions.

### 2.5. Summary

This section reviews literature of collocation studies in terms of the distinction among other phraseological combinations, several study domains, and their importance.

In 2.2., in order to distinguish idioms, collocations and free combinations, many linguists have reached a consensus about two criteria: (a) semantic opacity, which means whether the meaning of the combinations is retrievable from each constituent, and (b) collocational restriction, which refers to whether other synonymous words can be substituted for any word in the word combinations. Some linguists examine more criteria such as syntactic frozenness and peculiarity to a language to set a more precise boundary among them. However, as these criteria are a matter of degree, it
is difficult to clearly divide the three phraseological combinations which are along a continuum. Because of these features of phraseological combinations, inconsistent terms for collocation have been arisen.

In 2.3, previous literature on collocations is examined in five domains: descriptive studies, semantic studies, computational studies, lexicographic studies and pedagogical studies.

In descriptive studies, it is Firth (1957) who first elaborated the theory of meaning in terms of syntagmatic aspects of lexis and explored the distribution of words in a text and how some occur predictably together with others. His notion of collocation has profoundly influenced his successors in Firthian studies, who further examine collocations based on his concept. However, over the years, collocations have been gradually defined from more and more angles, using an increasing number of different features. This is necessary because collocations are impossible to describe in terms of only one feature. This reflects our increasing understanding of the complexity of collocations.

In semantic studies, in contrast to descriptive studies, semanticists, who have discussed lexical relations and types of meanings in terms of the paradigmatic aspect of lexis, criticize the studies of collocations by Firth and his followers as insufficient because of certain inadequacies. Then, they have attempted to investigate collocations in terms of the semantic framework and syntagmatic lexical relations under the scope of semantics. In spite of mentioning some shortcomings of the collocational studies by Firth and his followers, they do not give enough strong support for their concept and function of collocations in terms of semantic markers and so on. In the 1990s, in connection with the development of corpus linguistics, semantic prosody
became a new concept to express "a consistent aura of meaning with which a form is imbued by its collocates" (Louw, 1993, p. 157) and some researchers have examined it.

In computational studies, the interest of the researchers is to discuss collocation study in a certain environment in which the items composing collocations occur and to treat and explain collocation in objective ways, after judging from collocation data in large corpora. This is related to the development of computers. They have played an important role, giving researchers the means to analyze the frequency of collocations. Abundant information about collocations can be easily obtained from spoken or written texts by using "text-retrieval software" (Granger, p. 145) and it shows objectively the frequency of co-occurrence of certain words of collocations in a certain environment. Some researchers (Berry-Rogghe, 1973; Jones and Sinclair, 1974; Sinclair, 1966) have given precise definitions of collocation, node, collocate, and span, and a concretely appropriate span has been investigated. Kjellmer (1984, 1987) has been concerned with the distinctiveness of collocation and how it could be measured. Some researchers (Biber, 1993; Noel, 1992; Renouf \& Sinclair, 1991) have applied computer techniques to extract collocations automatically and to create corpora and dictionaries based on the concepts of Berry-Rogghe (1973) and Sinclair (1966). They have developed specific programs and techniques of analysis which can be used to do further collocation studies. Thus, researchers in the computational studies rely on computer technology and statistics for collocation studies.

However, they do not seem to be interested in features of word senses or any indication of the number of different meanings that words have. Biber
(1993, p. 531) mentions this point and says that computers are just a tool-it is still necessary for linguists to interpret the data they provide.

In lexicographic studies, researchers have been discussing some questions of collocations in a dictionary: Should collocations be regarded as separate dictionary entries? If so, which collocations and how many should be dealt with in the restricted space of a dictionary? General purpose English dictionaries have had a tendency to give as much collocational information as possible, but they have to provide other information such as grammatical information about the word. They have also seemed to have no consensus on important collocations. In order to overcome the shortcomings of general purpose dictionaries, collocation dictionaries including electric versions have been edited based on high-frequency collocations extracted from large corpora and development by computer technology.

In pedagogical studies, Lexical Approach advocates have made a breakthrough and have put forward the challenging concept that chunks, especially collocations, are a central component in language. Based on that theory, they have sought pedagogically effective practice to enlarge learners' mental lexicon by raising learners' attention of collocational knowledge from the early stages. In short, learning collocations explicitly and autonomously is fundamental in Lexical Approach and teachers should play a significant role to support learners to organize their notebooks containing many collocations, preparing activities, reviews and exercises on collocations. Thus, Lexical Approach advocates focus on collocations in language and concrete collocational teaching methodology.

An overview of collocation studies in the five domains shows that collocation is treated absolutely and comparatively. Researchers in
computational studies objectively deal with collocation using statistics and computers, whereas collocations should be managed by the comparison with other phraseological combinations. In short, some criteria such as frequency can be calculated with computers, but other criteria such as semantic opacity cannot.

In the last section, the importance of collocation is shown in terms of memorization, fluent and appropriate language use, aspects of knowing words, word models and teaching effectiveness. Based on these assumptions, empirical research is needed to clarify how collocations are acquired, what factors are related to the acquisition and so on. These will be introduced in the next chapter.

## Chapter 3. Literature review (2): <br> Empirical research on collocation

### 3.1. Introduction

In comparison with the collocation studies discussed in the previous chapter, empirical research on collocation from the perspective of L2 acquisition has been extensively conducted for the last two decades. This chapter briefly reviews the main empirical research on collocation to date.

### 3.2. Empirical research on collocation to date

Many researchers direct their attention to differences between L1 and L2 which seem to affect the acquisition of collocations with their original focus on their results and pedagogical implications. The pieces of research are divided into two groups: mainly in terms of L1 influence, and in terms of some factors including it. The following sections review their research in terms of the difference between L1 and L2 influence and other perspectives.

### 3.2.1. Collocation research mainly in terms of L1 influence

 Bahns (1993), Bahns and Eldaw (1993), Biskup (1992), Caroli (1998), Granger (1998) and Nesselhauf (2003) study collocations by contrastive analysis between L1 and L2, and stress the great influence of L1 on the acquisition and use of collocations.Biskup (1992) conducted a comparative study of advanced English of Polish and German students in order to discover the main causes of collocational errors and confirm the influence of L1 on production of L2
collocations. Her subjects were instructed to supply the English translation equivalents of lexical collocations in Polish and German separately. There were two main findings she discovered in her experiment. One finding was that the quantitative and qualitative results had something to do with different teaching policies in Poland and Germany. The Polish learners tended to avoid using collocations whose usage they were not convinced of, because the Polish teaching of English focused on accuracy. On the other hand, German learners tried to use alternative ways: paraphrasing and using definition, because they were used to taking English classes which were aimed at fluency of English communication. The other finding was that Polish learners were more dependent on L1 for producing English, while German learners looked for more creative strategies. This finding seemed to be related to semantic and formal similarity between L1 and L2 and the number of synonyms acceptable as collocates.

The purpose of Bahns and Eldaw (1993) was to investigate 58 German advanced EFL students' productive knowledge of English collocations including the ability to paraphrase them in a translation task and a cloze task. They had two main findings: (a) Collocations were a major problem in writing English for advanced students. (b) Students had particular difficulty paraphrasing them. Based on these findings, they suggested that EFL teaching should focus on those collocations which are difficult for learners to paraphrase.

As a significant sub-purpose of their collocation research, Bahns and Eldaw (1993) also examined the relationship between collocational competence and general vocabulary size. They could draw the tentative conclusion that "learners' knowledge of collocations did not develop in
parallel with their knowledge of vocabulary" (1993, p. 109). This might be in part due to the fact that collocations were not highlighted, considering how much vocabulary teaching was focused on. This emphasizes the need for effective collocation teaching.

Then, further questions were discussed by Bahns (1993): "Which of the tens of thousands of collocations do we select for special treatment in the classroom?" "And are there any criteria to decide which collocations need to be taught and which do not?" (1993, p. 58). Using a contrastive approach to the concept of lexical collocation, he found that the collocations, for which there are no direct translational equivalence, need to be focused on in the teaching of English to speakers of German and as a result, the enormous teaching and learning load can be reduced. In other words, in order to develop students' collocational knowledge based on this idea in their classes, a workbook which presents a selection of collocations geared to their specific difficulties with a particular L1 background should be provided, as Mackin (1978, p. 151) also suggests.

Nesselhauf (2003) also maintains that the collocations for which there are no direct translational equivalence should be focused on in her research. She reported an exploratory study that analysed the use of verb-noun collocations such as take a break or shake one's head used by advanced German-speaking learners of English in free written production. About 500 -word argumentative and non-technical writing by third or fourth year German-speaking university students of English was evaluated in terms of their acceptability. In her research, whether the combination written by the students is a free combination, a restricted combination or an idiom is determined by several native speakers of English, dictionaries such as the

Oxford Advanced Learner's Dictionary (OALD, 2000) and the Collins COBUILD English Dictionary (CCED, 1995) and the British National Corpus (BNC). The application to the data resulted in a database of verb-noun combinations classified as to their degree of restriction: free combinations, restricted combinations, more restricted combinations, idioms and to their degree of acceptability: clearly acceptable, largely acceptable, largely unacceptable and clearly unacceptable.

One of her results is similar to ones of Bahns (1993) and Biskup (1992) that the L1 influence on the production of collocations is rather high. The other result, her original one, shows that among verb-noun combinations the highest rate of mistakes occurs in combinations with a medium degree of restriction because of the wrong choice of verb on verb-noun combination mistakes. Therefore, the suggestion was made that the focus should be on the verb in the teaching of verb-noun collocations, since it is the verb that causes the greatest difficulties. Oikawa (1993) similarly recommends that core meaning of basic verbs should be taught, especially, for lower-level learners because they face difficulty in producing verb-noun collocations because of their L1, Japanese. Her other suggestion is that collocations should be taught with reference to L1 and it is important to teach them including prepositions, articles, etc, because of the difference between L1 and L2.

Nesselhauf (2003) implies that three criteria for selection of collocations should be considered. One is acceptability and frequency (p. 238). Collocations to be learned should be acceptable and frequent in a neutral register and any special register that is of use to the learner. The other two, which are more focused on by her, are restriction and congruence. As for
restriction, verb-noun combinations with a medium degree of restriction are the most frequently mistaken and so they should receive particular attention of learners. With respect to congruence, as non-congruence in L1 and L2 causes learners' errors, non-congruent collocations should be more focused on in language teaching. In addition, she found in her data analysis that even congruent collocations were mistaken, which is opposed to Bahns' argument (1993) that congruent collocations can be entirely disregarded because learners will automatically acquire them. Therefore, she strongly suggests that further research is needed on which congruent collocations are difficult for learners.

Caroli's research (1998) also focused on lexical collocations in terms of L1 and L2 difference on the acquisition of collocations. Her aim is to examine the influence of L1 on English collocational knowledge and the learning burden for learners, and illustrate the relation between the development of learners' knowledge of English collocations and their L1 vocabulary, and between the development of receptive and productive knowledge of collocation. Seventy-three Italian learners of English at upper secondary schools were asked to take Nation's vocabulary test (1990), productive collocation test and receptive collocation test consisting of 15 Italian literal equivalent collocations and 15 non-equivalent collocations.

One of Caroli's results, which is identified with that of Bahns and Eldaw (1993) but which is opposed to that of Gitsaki (1999), is that no close correlation was found between the general vocabulary knowledge and the collocational knowledge. In other words, even if general vocabulary increases steadily with the level of language learning, it does not necessarily mean that collocational knowledge increases at the same rate. Another result is
that at all stages of language learning, learners seem to have higher receptive knowledge of collocations than productive knowledge of collocations. The other result, which is related to L1 and L2 difference, is that learners at the early stage of vocabulary development resort to L1 features in selecting possible English collocates and gradually come to comprehend the correct target language feature. Furthermore, Italian literal equivalent collocations are more easily acquired, which provides less burden for learners than non-equivalent collocations, as many researchers mention.

As many researchers suggest as pedagogical implications, Caroli (1998) also proposes that a word should be presented with some of its most frequent collocates and that teachers should have the responsibility to create conditions which effectively compensate for the foreign learners' lack of collocation learning.

Granger (1998) investigated the difference in productive collocations and formulae between native speakers of English and French learners of English based on the International Corpus of Learner English (ICLE). Above all, in the first part of her investigation, she focused on the collocational study of amplifiers functioning as modifiers of adjectives such as totally or highly, proposing the hypothesis that learners would use them less frequently than native speakers. She found that the frequencies of two amplifiers, completely and totally, which were direct translation equivalents in L1, were much higher than those of other amplifiers. This might be because by using amplifiers which are similar to the equivalent in French, they did not need to become risk takers and could avoid making mistakes. In short, L1 played an important role in collocation acquisition and use in the L2.

From the pedagogical implications of her research, Granger suggested
that EFL material should be developed based on this result to give learners the most efficient learning aid. She also proposed that EFL teaching programmes should not rely much on first language acquisition theory, citing Cowie (1998) that "the child first acquires 'chunks' of language, then analyzes them and finally develops from them regular syntactic rules" (p. 14). This is because there is not enough evidence to apply the theory to the collocational acquisition for L2 learners. She concluded that empirical work was urgently needed to investigate the mechanism of collocation acquisition, using both the wide variety of large computer corpus and the introspective tests.

### 3.2.2. Collocation research in terms of several factors including L1 influence

Kellerman (1979), Farghal and Obidedat (1995), Fayez-Hussein (1990), Gitsaki (1999), Elyildirm (1997), Dechert and Lennon (1989), Lennon (1996) and Blum and Levenston (1978) attribute L2 learners' insufficient collocational knowledge to various factors.

Kellerman (1979) believes that learners could make use of their native language in their target language production where they have a deficient target language proficiency. How learners rely on the native language to produce their target language is explained in terms of L1 influence within the framework of learners' perception of the distance between the native language and the target language and also the degree of markedness of L1 items, which is crucial for transfer. If learners perceive the distance between the target language and the native language to be greater, the influence of transfer will be lower, while if they perceive distance between them to be a
little, then they will transfer the relevant items or structure from their native language. The other framework, markedness, refers to such features as irregularity, infrequency, semantic opaqueness, and unmarkedness as regularity, frequency, productiveness, semantic transparency, and coreness in his classification. Markedness is assigned to the native language item to be transferred. If the markedness level is too high, transfer will be blocked, and if the markedness level is not high, it will functions as language distance. Thus, the interaction of the two factors, distance and markedness, will determine whether transfer is activated or not.

To prove L1 influence on learners' target language production, Kellerman (1979) conducted two experiments: one is about the transferability of idiomatic expressions and the other is about native speakers' intuitions about semantic space. The first experiment was carried out with 72 first-year to third-year Dutch learners of English at a university who were given 20 Dutch-based idiomatic expressions and asked to judge if they were correct English or not. The main result showed that idioms are not subject to transfer, probably because they are marked expressions for them. The second experiment was conducted with 81 Dutch learners of English to investigate the effect of the native language in terms of coreness and unmarkedness of words as against peripheral and marked meaning. He hypothesized core meaning and unmarked meaning would be transferred to the second language. The subjects were given 17 sentences presenting the core and non-core senses of the word breken (i.e. break) such as break his leg and break the record and judged which combinations were correct in English. The results confirmed Kellerman's hypothesis and he argued that there may be some factors such as coreness and frequency affecting transferability from
the mother tongue to the second language. Thus, he strongly argues that transfer from the native language plays a big role in the process of acquisition of the target language.

Learners' insufficient knowledge of collocation affected by lack of solid general English proficiency is reported by Fayez-Hussein (1990). The aim of his research is to access 200 third-year and fourth-year Jordanian university students majoring in English as to their ability to collocate words correctly in English. A multiple-choice test which consisted of 40 lexical collocations was used to evaluate the students' collocational knowledge. The result showed the lack of their collocational knowledge (only 48.4\% of the collocations were answered correctly, which was far less than the anticipated scores of $60 \%$.) The $48.4 \%$ indicates these collocations are frequently encountered in daily task in their classrooms, while the collocations which were answered incorrectly are due to unfamiliarity with collocational structure, overgeneralization that learners attempt at reducing the syntactic and lexical aspects of the language to simpler and more regular system easier to them, and L1 negative transfer which was responsible for the highest percentage (49.4\%) of incorrect answers. He stated that the three main causes of incorrect answers, namely, unfamiliarity, overgeneralization and L2 negative transfer, resulted in the tendency of simplified learning in a second language learning situation. Citing Jain (1974, p. 197), he argues that many components such as teaching materials, teaching techniques, popular school grammars and teaching and learning goals attempt to bring about simplified learning for EFL learners. As a result, the learners generally ignore acquiring and using specific terms and subsume them in generic terms.

Based on these results, he stresses the importance of the teachers' role for its pedagogical implications. Teachers should introduce collocations systematically to learners to make them observe the restrictions on the co-occurrence of items within a sentence, especially lexical combination.

Gitsaki (1999) investigated the relation between learners' English collocational knowledge and their overall language proficiency in three different proficiency levels and factors influencing the acquisition of collocations. After dividing 275 Greek learners of EFL into post-beginners, intermediate learners and post-intermediate learners, three tests - essay writing, a translation and fill-in-the-blank test-were conducted in terms of 37 types of collocations, while many linguists focus on limited types of collocations.

Gitsaki (1999) got two main results from her research. One shows that there is significant development of collocational knowledge as overall language proficiency develops, which is against Bahns and Eldaw (1993) and Calori (1998). The other result, which is exaggerated as important in collocation teaching and learning, is that whether 37 types of collocations are acquired early or later is determined by some influential factors: maturation, language proficiency, instruction, saliency, L1-L2 difference, complexity and arbitrariness of collocations. She explained these factors as follows:

Collocational knowledge develops as overall language proficiency develops, as students become more mature, and as more exposure to collocations takes place. The development of collocational knowledge is also influenced by the 'salience' of the particular collocation types. Grammatical collocations that are simple and frequent in every day speech are acquired early. The more complex structures are acquired later. Lexical collocations are more difficult to acquire than the
simple grammatical collocations. They are syntactically simple, but their acquisition is affected by other factors of 'semantic complexity', e.g. arbitrariness, predictability and idiomaticity, i.e. the more fixed and idiomatic they are, the more difficult they are to acquire. (p. 146)

Based on these results, she suggested two pedagogical implications for designing materials and instructing about collocations in the classroom. The knowledge of order of acquisition of collocations can help syllabus designers and teachers present collocations to facilitate learners' step-by-step development of collocational knowledge. The other is that teachers can easily access many teaching materials for learners' different English proficiency and provide them with more information on collocations.

Farghal and Obidedat (1995) reported that collocation teaching in EFL classes is important, but in general neglected. An English fill-in-the-blank test and an Arabic translation test involving 22 common collocations about core topics such as food, color and weather provided to the third-year and fourth year English majors at Yarmouk university and language teachers of English respectively. The results showed serious deficiency in collocations in both groups. The causes they analyzed arose from subjects' lexical simplification like the use of synonymy, paraphrasing, avoidance and L1 negative transfer. They mentioned that it was due to language instructors' tendency to teach words individually rather than collocationally and to learners' tendency to fail to exploit distinction of collocations in their writing and speaking and to lack common collocations in their repertoire. Based on the results, they made two main suggestions for pedagogical implications that collocation should be highlighted as an important aspect of language learning as well as idioms and learners' attention should be directed to the
lexical divergences between the collocations in L1 and L2.
Elyildirm (1997) argued the importance of collocation acquisition by both quantitative research and qualitative research. He conducted two research studies on the treatment in EFL textbooks of the most frequent verb-noun and adjective-noun collocations taken from the Lancaster-Oslo/Bergen Corpus (LOB corpus) as a representative sample of the natural language data and the acquisition of collocational knowledge by learners in terms of generalization, overgeneralization, comprehension and production of the items given in the local textbooks. First, a comparison of EFL textbooks in Turkey and international textbooks at four different levels in terms of target collocations extracting from the LOB corpus was made and it was found that few target collocations was treated in both sets of textbooks and there was no pattern or gradation of collocational input. Moreover, collocations occurring in both textbooks were not treated explicitly nor implicitly with practice exercises. Therefore, learners are not provided with adequate and appropriate input of important collocations with the textbooks. The second data analysis from the three collocation tests - correct or incorrect test, translation test and fill-in-the-blank test-were examined in terms of generalization, overgeneralization, comprehension and production of the target collocations. The results showed that learners tended to generalize the unfamiliar combinations in reference to the frequently used collocations in textbooks and to overgeneralize incorrectly on answered collocations with incomplete knowledge of collocability of the target items and L1 negative transfer. As for L1 negative transfer on comprehension and production of the target collocations, collocations which were literally equivalent to learners' native language were easily acquired and collocations which were different
from it were difficult to acquire, as many linguists mentioned. Thus, the lack of input of collocations in the textbooks leads learners to generalize the unfamiliar combinations in reference to collocations they have frequently seen in the textbooks, overgeneralize collocations and resort to their L1.

As the pedagogical implications, he made the following suggestions for textbook writers, material writers, language teachers and learners. In compiling textbooks, textbook writers should take into consideration learners' needs and interests, high-frequency collocations in the appropriate context. Material writers should check the collocational differences and similarities between L1 and L2 before preparing the materials because L1 is an influential determiner. Language teachers should direct learners' attention to high-frequency collocations explicitly with intensive and practical teaching to activate learners' collocability and encourage them to use previously encountered lexical collocations more productively. Learners should attempt to spend much time improving their collocational knowledge through reading and listening to produce them instead of avoiding them.

The interest of Blum and Levenston (1978) was on the semantics of interlanguage formation. In order to investigate L2 learners' process of acquiring the target language, they hypothesized the four processes learners were likely to use: overgeneralization of hyponymic relationships, overgeneralization of antonymic relationships, neutralization of register restriction and neutralization of collocational restriction. Two data analyses were made in different subjects: the work with learners of English and the work with learners of Hebrew. First, with the work with learners of English, the subjects were 100 native speakers of Hebrew who were all university students, aged 18 to 25 years, male and female and 80 learners who were 17
year-old high school students, in their seventh year of learning English at one of the foremost high schools in Jerusalem. Second, with the work with learners of Hebrew, the subjects were 100 native speakers of Hebrew who were all university students, aged 17 to 26 , male and female and 100 learners of Hebrew who were English, Spanish, Hungarian and Rumanian and who were also university students, aged 17 to 26 male and female. In both analyses, the results of two tests were examined - a multiple-choice test and a fill-in-the-blank test - with a subsequent translation test into Hebrew. The purpose of these tests were to make comparison between the learner's receptive knowledge of vocabulary and productive knowledge of vocabulary and between the patterns of learners' different behaviors about when they knew a word and when they did not.

These two analyses revealed that in producing a word, learners showed overgeneralization of hyponymic relationships and antonymic relationships, and ignorance of the register-restriction by choosing words of general use as a strategy of communication especially when they encountered words which had no equivalent in their mother tongue. The finding indicated that these learners were ignorant of the restricted collocations rather than ignorant of the words themselves. From this finding, Blum and Levenston (1978) assumed that at the initial stage overgeneralization and ignorance were manifested as a strategy of avoidance and at a later stage, as more semantic information was acquired, the process might lead to fossilization and when a collocation was learnt holophrastically, the process was inoperative.

Dechert and Lennon (1989) and Lennon (1996) conducted error analysis in learners' essay and explained the reasons of learners' errors. According to Dechert and Lennon (1989), error analysis in essays written by two
advanced-level university students who spent much time in England was carried out, focusing on the syntagmatic blend occurring in the subjects' writing. They set up their research questions (pp. 164-165): "Why was it so full of collocational blends? Why had their apprehension of collocational affinities between lexical items not reached a state of proceduralized automaticity?" They explained the answers to these questions in terms of the following two factors: extra-casual blends and intra-casual blends. The extra-casual blends resulted from an incoherent assemblage of their thoughts which had not been properly differentiated, ordered and linked so as to form a coherent thought, because the ability to express their thought appropriately in a second language in various contexts in classes had priority over their ability to organize and to relate thoughts coherently. The intra-casual blends seemed to be caused because these students were not taught in details how lexical items in English might collocate at the phase level. In other words, the area between lexis and grammar/syntax, collocations, had been neglected. It is because they were much more used to a natural casual style of communication in English and not used to writing an essay on a complex topic from an unfamiliar subject area. These two points came out of the two students' collocational deficiency.

The investigation of verb choice errors was made by Lennon (1996) with analysis of a corpus of 745 oral errors which were collected transcripts of recordings of picture-story narrations made on 15 separate occasions by four female advanced German learners of English who spent six months at the University of Reading in England. The errors were divided into 10 discrete categories: intra-lexime, intra-VP, intra-Verb-Group, preposition and adverbial particle choice, pro-forms choice, adverbial and particle position,
verb complementation, clause linkage, sentence structure and lexical choice. The result indicated that among them lexical choice was the weakest and especially lexical verb choice seemed to be vague and problematic for these four subjects, although they had a broad comprehension of verb meaning, because they might over-rely on their ideas of core meaning of polysemous verbs and might be derailed by translation equivalents into L1. The subjects tended to transfer their native language to the target production or overgeneralize the use of some common verbs such as put, go, and take, so that their deficiency of knowledge of collocational probabilities would be compensated. Based on the results, Lennon (1996) stated that the advanced learners should not rely on translation and become familiar by some practice with simple high-frequency verbs, by which learners explore meaning-ranges and limitations, collocational possibilities and restrictions and sense relations.

### 3.2.3. Other collocation research

The interest of Cowie and Howarth (1996) and Howarth (1998a, b) was in analysing phraseology in the written English of advanced second or foreign language learners. They tried to discover the phraseological norm of native speakers of English and examine how learners' usage deviates from such norms. They investigated how phraseological knowledge contributes in written English, comparing four essays of one native and one non-native university students, all of between 1500 and 3000 words on topics in applied linguistics. One of their main findings showed that there was a measurable overlap in collocational use between a proficient native speaker of English and a relatively proficient non-native speaker of English in the proportion of
usage of a verb and a noun pattern to the whole essays. The other finding was that it did not seem that writers' knowledge of collocations developed through repeated use or through massive exposure to them in the writing, as Granger (1998, p. 156-158) discussed. In other words, it seemed that writers were becoming familiar with collocations through their experience of perception of their "idiosyncratic properties and specifically of arbitrariness with which their components select each other" (1996, p. 92).

From the pedagogical perspective, Howarth (1998a, b) criticized that the present EFL teachers, by both native and non-native speakers, little understood the phraseological mechanisms of the language. In fact, as learners' English proficiency developed, teachers tended to instruct their learners to memorize an increasing number of idioms, which "form a very small proportion of the items identified for both native writers and non-native, and arguably present less severe problems for learners" (Cowie, 1998, p. 14). He also pointed out that EFL materials appeared to show only two categories of word combinations: idioms and free combinations, focusing learners' attention only on them. Consequently, many learners failed to notice and understand the existence of collocations, which were the central area of the phraseological spectrum between idioms and free combinations.

Among early studies of collocations, Greenbaum (1970) conducted a questionnaire to 300 native speakers of English, who were told to complete a series of sentences using the given key words. He focused on a few degree adverbs such as completely and greatly and his results indicated that there were strong collocational links. For instance, utterly and completely tended to take pejorative verbs and adjectives, while greatly and much collocated with admire and enjoy.

The "native-like proficiency of a language depends crucially on knowledge of a stock of prefabricated units" (Cowie, 1994, p. 3168) obviously involves knowledge of collocation. Herbst (1996) conducted translation, a cloze-test and a completion test, which consist of 100 test items, to 100 students of English at two German universities and 58 English students at four English universities and compared the results of the two groups. The result clearly revealed that a particular collocation was more used by native speakers of English than by German speakers of English. Strong supporting evidence to his argument came particularly from the completion test. Some of the test items used in the completion test were identical with Greenbaum's (1974) and it was found that the result of the English native speakers was quite similar to Greenbaum's, while the results of the German students were different. This research showed that the German students' collocational knowledge was obviously deficient, compared with that of English native speakers.

Channell (1981) aimed to propose an approach to the teaching of English vocabulary. In the third section of his paper which gave examples of teaching material and exercises, he maintained that knowing which words a word collocated with was an important aspect of vocabulary acquisition. In his research, eight advanced EFL students of English were asked to fill in collocational grids which consist of adjectives (e.g. handsome, pretty, charming and lovely) and nouns (e.g. woman, voice, view and dress). The result showed that learners failed to mark a large number of acceptable combinations between nodes and collocates, although they were individually familiar with these words in the research. He mentioned as a pedagogical implication that words should be presented with high-frequency collocates
when they were first encountered by learners.
Ghadessy (1989) investigated language and discourse structure development at two educational levels (PR3 and PR6) of primary school pupils in Singapore $(\mathrm{N}=176)$ by comparing the two groups' free compositions for a set of four pictures. The analysis of a few key vocabulary items in the two sets of data illustrated some of the major differences between the two groups of students. For example, in the section of collocation, two very high-frequency words, ball and tree were analyzed in terms of the words which occurred with them. The result indicated that higher level students used more pre-modifiers with these two nodes and more advanced structure. On the other hand, post-modifiers were used less frequently for both two groups and no balanced development of the targeted structure could be seen. He did not reach a generalized conclusion from the results which he obtained, because of the small number of items tested.

### 3.2.4. Summary

Many researchers conducted empirical research in terms of various perspectives to realize how learners' collocational knowledge was developed. Their empirical research on collocation to date is summarized in the following Table 9:
Table 9. Empirical research on collocation

| year | research | collocations | subjects | instrument | results |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1970 | Greenbaum | verb-adverb collocations | 300 native speakers of English | questionnaire | - There were close collocational links between greatly and much, and admire and enjoy |
| 1978 | Blum and Levenston | general use of collocations | 1. 100 native speakers of English at universities and 80 Hebrew high school students 2. 100 Hebrew university students and 100 learners of Hebrew | multiple choice test, fill-in-theblank test, and translation test for L2 learners | - In producing a word, overgeneralization of hyponymic relationships, antonymic relationships and ignorance of the register-restriction by choosing words of general use can be seen as a communication strategy especially when learners encounter words which have no equivalent in their mother tongue. |
| 1979 | Kellerman | idiomatic expressions | 72 Dutch learners of English at a university | correct or incorrect test | - Trace of negative transfer from Dutch is not identified. |
| 1979 | Kellerman | 17 sentences containing core and non-core senses of the word 'break' | 81 Dutch learners of English at a university | correct or incorrect test | - Coreness and frequency are the factors affecting transferability from the mother tongue. |
| 1981 | Channell | adjective-noun collocations | eight advanced EFL students | collocational grid | - Students failed to mark a large number of acceptable collocations, although they were individually familiar with the words. |
| 1989 | Dechert and Lennon | general use of collocations | two advanced-level university students who spent much time in England | free writing task | - The reason why the subjects' writing was so full of collocational blend is due to extracausal blend and intra-casual blend. |
| 1989 | Ghadessy | general use of collocations | 176 primary school students in Singapore | writing test based on pictures | - Higher level students used more pre-modifiers with two key words, ball and tree and more advanced structures. <br> - post-modifiers were used less frequently by both higher level students and lower level students and no balanced development of the targeted structure could be noticed. |

| year | research | collocations | subjects | instrument | results |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1990 | FayezHussein | 40 lexical collocations | 200 undergraduate Jordanian students majoring in English | multiple choice test | - Learners' collocational knowledge is deficient. <br> - Incorrect collocations are due to unfamiliarity with collocational structure, overgeneralization and negative transfer. |
| 1992 | Biskup | lexical collocations | advanced Polish and German students of English | English translation test | - Polish learners were dependent more on L1 for producing English, while German learners looked for more creative strategies. <br> -Polish learners tended to avoid unknown collocations, while German learners tried to use alternative ways. |
| 1993 | Bahns and Eldaw | 15 verb-noun collocations | 58 German advanced EFL students | translation and cloze test | - German students had problems with collocation in writing and they particularly had difficulty paraphrasing collocations. <br> - Learner's collocational knowledge does not develop in parallel with their general vocabulary knowledge. |
| 1995 | Farghal and Obidedat | 22 common collocations | undergraduate Arabic English majors and language teachers of English | fill-in-the-blank test and translation test | - Both subjects have deficiency in collocations because of lexical simplification, avoidance and transfer. |
| 1996 | Cowie and Howarth | phraseological combinations | one native and one non-native university students | free writing task | - There was a measurable overlap in collocational use between proficient NSs and relatively proficient NNSs in the proportion of usage of a verb-noun collocation <br> - Subjects are becoming familiar to collocations through their experience of perception of their idiosyncratic properties and specifically of arbitrariness with which their components select each other. |
| 1996 | Harbest | general use of collocations | 100 German students of English at two German universities and 58 English students at four English universities | translation test, a cloze-test and a fill-in-the-blank test | -German students' collocational knowledge is deficient. |

| year | research | collocations | subjects | instrument | results |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1996 | Lennon | general use of collocations | four female German university students who had spent six months in England | recordings of oral picture-story narrations | - Lexical verb choice is vague and problematic for the four students. <br> - Subjects over-rely on their ideas of core meaning of polysemous verbs and translation equivalents in L1 |
| 1997 | Elyildirm | verb-noun, adjective noun collocations | 121 Turkish tenth-grade students at upper secondary schools | correct or incorrect test, translation test and fill-in-theblank test | - Learners tend to produce collocations, resorting to generalization, overgeneralization, and L1 transfer. |
| 1998 | Caroli | 30 verb-noun collocations | 73 Italian learners of English at upper secondary schools | fill-in-the-blank test and multiple choice test | $\cdot$ No close correlation was found between the general vocabulary knowledge and the collocational knowledge. <br> - Learners have higher receptive knowledge of collocations than productive knowledge of collocations. <br> -Learners at the early stage of vocabulary development resort to L1 features in selecting possible English collocates. |
| 1998 | Granger | adverbial collocations | native speakers of English and <br> French learners of English based on ICLE | corpus study | - The frequency of amplifiers which were direct translation equivalence in L1 was much higher than those of other amplifiers. |
| 1999 | Gitsaki | 37-type collocations | 275 Greek learners of English of EFL | free writing, translation test and fill-in-the-blank test | - Whether collocations are acquired early or later is determined by some influential factors: maturation, language proficiency, instruction, saliency, L1-L2 differences, complexity and the arbitrariness of collocations. |
| 2003 | Nesselhauf | verb-noun collocations | German-speaking university students of English | free writing task | - The L1 influence on the production of collocations is rather strong. <br> - The highest rate of mistakes occurs in combinations with a medium degree of restriction because of the choice of verbs. |

### 3.3. State of collocation research in Japan to date

Research on collocation in Japan used to be very limited, because conducting research on collocation was thought to be very difficult: the definition of collocation was vague and Japanese terms for collocation were different according to different English textbooks, word books, dictionaries and so on. It seemed that collocation was the last study field in the lexis which English teachers and researchers carried out research on, although they had already regarded collocation as very important for Japanese learners of English.

However, collocation research is now in the spotlight to some extent. This is because collocation research is closely related to various corpora in association with the development of computer technology. As collocation research based on corpus study is making progress, some researchers such as Matsuno and Sugiura (2002) and Nakamoto (1997) have started a tendency to redefine collocation. The effect of corpus study also influences the compilation of recent English-Japanese dictionaries. As the importance of collocation is recognized, more and more dictionaries are designed to present not only the meaning, the usage and the examples of as many words as possible, but also collocations necessary for the users.

This section introduces collocation research in Japan and the description of collocations in English-Japanese dictionaries.

### 3.3.1. Collocation research in Japan

Nakamoto (1997) and Matsuno and Sugiura (2002) try to present a clear definition of collocation in their studies.

Nakamoto (1997) aims at improving the description of collocation in

English-Japanese dictionaries by giving a new definition of collocation. Reviewing 16 selected books and articles on semantics and lexicography which mention collocation critically, he divides the definitions of collocation in them into three criteria for judging whether a given combination can be regarded as a collocation: frequency, collocational expectancy, and semantic opacity (of a constituent). He concludes that all of the criteria should be combined in deciding how fixed a given combination is and L1 influence should be considered in applying this collocation frame to a description in dictionaries.

Matsuno and Sugiura (2002) are also interested in redefining collocation as Nakamoto (1997). Researchers have no consensus on the definition of collocation whether it is for a pedagogical point of view or for a linguistic point of view. They propose six criteria to define collocationfrequency of co-occurrence, collocational strength, restricted connectability, grammatically structured, semantically transparent, and adjacency and span. They state that collocations have various characteristics so that they should be identified from these several criteria.

As corpus linguistics has attracted attention for the last decade, collocation research through corpus is becoming popular in Japan. Tono (2003) maintains that one of the advantages obtained from corpus study is frequency and strength of collocations. Teachers used to rely on the native speakers' intuition about which combinations are right or wrong, but now they have access to corpus to check high-frequency collocations. The strength of collocations can also be calculated by using statistics such as MI-score, t -score and z-score. Moreover, in the natural language processing, collocation information can be retrieved from corpora in an on-demand real-time
server-client environment and the results can be adopted to machine translation (Haruno 1998, Sato and Lee 2003). Tono (2003) also recommends more learners' corpora should be gathered to get more information on L2 acquisition. Examples are International Corpus of Learner English (ICLE) which consists of more than 500 -word argumentative essays collected from third-year or fourth-year advanced ESL students in about 19 countries (http://www.fltr.ucl.ac.be/fltr/germ/etan/cecl/ Cecl-Projects/Icle/icle.htm) and SST corpus which is computerized audio data from Standard Speaking tests.

Yoshimura (2004) is interested in efficient use of corpora to facilitate learners' collocational knowledge and proposes several classroom activities for college-level upper-intermediate students with corpora. For example, filling in a collocation grid is an activity in which students are asked to select acceptable collocations, unacceptable collocations or unknown collocations. The activity is meant to have learners pay more attention to high-frequency collocations. Counting target collocations in the corpus is an activity in which students are asked to count the frequency of several pairs, translate the pairs into their L1 and compare the word order in both languages (e.g. back and forth vs. zengo in Japanese). Accessing concordance lines is an activity in which students are asked to check the target collocations in concordance lines. The activity is meant to make learners aware of the semantic prosody of the combinations. Yoshimura (2004) mentions as her conclusion that activities of collocation via corpora have the potential to raise learners' awareness of collocations, although these activities might be a heavy burden to teachers.

Kobayashi (2004) uses several corpora to examine frequency of have-noun collocations by Japanese learners of English in comparison to the
frequency in two other corpora which are collected from native speakers of English. The corpora used in this research are the following three: Japanese corpus among sub-corpora of ICLE, Louvain Corpus Native English Essays (LOCNESS) and Usbooks. The Japanese corpus comprises 146,692 words from 289 Japanese learners of English. LOCNESS consists of 144,853 words from 176 American university students. Usbooks is a sub-corpus of the Bank of English and is gathered from books published in the US. The first finding is that Japanese learners of English tend to use definite expressions such as have-noun and the use is influenced by Japanese. The second finding is that Japanese learners of English use have-adjective-noun expressions less than native speakers of English in the US. Based on these findings, she argues that raising learners' awareness of frequency adjective-noun collocations is important.

Usage of collocations in literary works is highlighted by Hori (2004). He maintains that collocation study is necessary to examine their style of writing as Firth (1957), and not high-frequency but creative collocations should be considered important as the degree of creativity in literature. He examined the collocational style in a corpus of Charles Dickens' works and stressed the importance of his analysis.

Akimoto (1999) reviews the development of idioms and collocations from a historical point of view. His interest is especially focused on do, give, have, make, take + deverbal noun and those with verb plus postverbal particle, up, down, off, out, through, over, away from old English to late modern English. He concludes that although their book is limited to some specific words such as complex verbs, phrasal verbs and complex prepositions as exemplars of idiomatizational and collocational processes, there could be other areas
related to these concerns, which deserve studying in order to develop a preliminary understanding of them.

### 3.3.2. Description of collocations in collocation dictionaries and English-Japanese dictionaries

Thanks to the development of corpus studies, collocation studies have made rapid progress which results in better treatment of collocations in English-Japanese dictionaries from both a scientific point of view and a pedagogical point of view. The growing popularity of electronic dictionaries, due to their reasonable price and the portability, began to add extra formation such as collocational information and more communicative information to general English-Japanese dictionaries in new editions.

There are a couple of English dictionaries which treat only collocations in Japan: The Kenkyusha Dictionary of English Collocations (1995) and the Dictionary of English Basic Words' Usage (1999), and English-Japanese dictionaries have attempted to present as much collocational information as possible.

The Kenkyusha Dictionary of English Collocations (1995), the first English collocation dictionary in Japan, was first published in 1939 and revised in 1995. This dictionary was designed to help learners produce appropriate English sentences on the basis of collocation as a key factor whose meaning is the habitual association of words. Therefore, unlike general English-Japanese dictionaries, it focused on word combinations with nouns, verbs and adjectives and listed 200,000 examples. When revised, to provide more current and rich examples for learners, 380,000 examples of word combinations with three word classes are listed, renewing $80 \%$ of all
examples as the result of access of an original corpus gathered by Kenkyusha. Thus, the Kenkyusha Dictionary of English Collocations has been used by many Japanese learners of English owing to its abundance of examples and has recently been included in electronic dictionaries.

Edited from more scientific point of view is the Dictionary of English Basic Words' Usage (1999). Words which collocate with 874 basic words for Japanese learners of English were selected from a 931,303 word corpus gathered from 10 sources: personal conversations, personal letters, literary works, Japanese textbooks of English, newspapers, business letters, science abstracts, broadcast English, weekly magazines, and women's speech. The combinations were also checked by native speakers of English who have intuition about word combinations. As a consequence of the analysis with a corpus study and checking by native speakers of English, the frequency of the combinations, the examples, the sentence patterns and sentence structure were all presented in this dictionary. Thus, the compilers of this dictionary aim to have learners acquire basic collocations to improve their listening ability based on the theory that it is difficult to attain considerable listening skill without a knowledge of collocations as well as that of words.

Collocations in many English-Japanese dictionaries in Japan used to be treated as one of the most important factors with word meanings and usages, appearing in bold face. However, some new English-Japanese dictionaries published or revised in 2000s have consciously introduced frequently used word combinations as collocations and treated them as more remarkable factors in more highly visible ways.

The Lighthouse English-Japanese Dictionary (fourth edition, 2002), which consists of 62,000 words, highlights collocations in bold face. Moreover,
of the many collocations, verb-noun collocations are taken special notice of and introduced in the distinct section to have learners recognize them. The Luminous English-Japanese Dictionary (first edition, 2001), which is published by the same publisher as The Lighthouse English-Japanese Dictionary but which consists of 99,000 words for more advanced learners, also utilizes the same treatment for collocations as The Lighthouse English-Japanese Dictionary does.

While the two English-Japanese dictionaries mentioned above focus on verb-noun collocations among lexical collocations, The Super Anchor English-Japanese Dictionary (third edition, 2003), which comprises 66,300 words, seems to treat each lexical collocation to be equally important. In it, grammatical collocations are written in bold face, but lexical collocations such as adjective-noun collocations, verb-noun collocations and verb-adverb collocations are added in a special section.

The Lexis English-Japanese Dictionary (first edition, 2003), which consists of 98,000 words, has an original special section for English usage including collocations. As a whole, the relation between verbs and prepositions is focused on and appears in bold face. However, the sections which are called planet board show the acceptability of expressions judged intuitively by 103 native speakers of English who live in the US (41), the UK (41), Canada (9), Australia (7) and New Zealand (5). For example, those who live in the US and the UK chose get to the question, answered the question, "If you don't [do / get / have / take] more exercise, you'll get fat" (p. 611). While the other verbs are used much less than get, do and take are also frequently used in the UK. The planet board is intended to show that data from corpus and data from the native speakers' intuition are both
complementary to each other in selecting important expressions for Japanese learners of English.

### 3.3.3. Summary

As mentioned above, a little progress has been made in the study of collocation for second or foreign learners of English. In Japan to date, although empirical research from an L2 perspective is still at an early stage, the description of collocation in English-Japanese dictionaries is improving due to increasing awareness about the importance of collocation.

All the researchers reviewed in this chapter urge the necessity and importance of collocation teaching and learners' development of collocation competence by contrastive analysis, error analysis or comparison of strategies of native speakers of English and non-native speakers of English. What are needed are materials and workbooks which present a selection of collocations focused on learners' specific difficulties, especially with their L1 background. However, research conducted so far is not enough to clarify what the mechanism of acquisition of collocations is like, how collocations should be taught in a classroom, and what kind of materials should be provided. Further research on collocations from different angles of an L2 perspective is to be done.

## Chapter 4. Pilot study

### 4.1. Introduction

This chapter proposes an original definition of collocation for the following two types of research, referring to previously examined theoretical and practical research on collocation, and then, presents pilot studies to clarify purposes, research questions and experimental procedures before main data analyses.

### 4.2. Definition of collocation in the present research

Collocation has traditionally been defined as "the company words keep", following Firth's definition. However, as this definition is not clear enough to conceptualize collocation, many researchers have proposed various criteria, which can be divided into two main groups: objective criteria and subjective criteria. Objective criteria can be identified with statistics such as z -score, t -score and MI-score and include frequency of co-occurrence, collocational range and adjacency (span). Subjective criteria cannot be calculated because it is a matter of degree along a continuum and includes collocational restriction, syntactic structure, and semantic opacity.

Table 10. Two main criteria defining collocation

| objective criteria | frequency of co-occurrence, collocational range, adjacency (span) |
| :--- | :--- |
| subjective criteria | collocational restriction, syntactic structure, semantic opacity. |

As some researchers (Gramley \& Pätzold, 1992; Matsuno \& Sugiura, 2002; Nakamoto, 1997; Nation, 2001) argue, collocations should be defined from both of these two main criteria in order to identify their framework
more clearly. Objective criteria are landmark for EFL teachers and learners because new objective facts about English collocations, i.e. how collocations are actually used, can be obtained easily via computers without relying on native speakers' intuition. On the other hand, subjective criteria are still taken into consideration, because corpora in which the objective criteria are examined still have some shortcomings such as incomplete and lopsided record of fact in spite of the usefulness (Cook, 2003, see section 4.3.6.). In order to make up for the shortcomings of objective criteria, subjective criteria are still important.

As summarized above, both objective and subjective criteria are adopted to define collocations in this study. Objective criteria such as high frequency of occurrence, z-score, and $\mathrm{N} \pm 4$ span are adopted in corpus-based research. On the other hand, subjective criteria are also broadly applied in empirical collocation research and all the multiword expressions except pure idioms in the figure by Fernando (1996, p. 32) are adopted as collocations (see section 2.2.1.). The reason why Fernando's definition of collocation is determined to be used in this study is that he provides a systematic and varying concept of idioms and habitual collocations based on semantic opacity and collocational restriction.

### 4.3. Pilot Study I: Corpus-based research

Following the definition of collocation presented in the previous section, the basic collocations should be identified that Japanese learners of English need to acquire to develop a better command of English by effectively teaching them. In order to examine the reality of collocation teaching in Japan, the treatment of collocations in English textbooks should be
investigated because they are the main materials to teach basic English to secondary school students. Therefore, the following four corpus sources were chosen for this study: English I textbook corpus; English II textbook corpus; former English I textbook corpus and revised English I textbook corpus; and UK history textbook corpus. Among various word combinations, verb-noun collocations were chosen in this pilot study in that they are most frequently used combinations, are regarded as key combinations in producing clauses and sentences, and they are the most often targeted in the previous empirical research. English I textbooks for the $10^{\text {th }}$ graders were used for these pilot studies on the ground that they are compiled to cultivate comprehensive English ability. The government guidelines for foreign language teaching explain that English I textbooks' purpose is to develop students' basic abilities to understand speakers' and writers' intention about things of everyday life, to tell and write about their intentions and information, and to foster a positive attitude toward communication. Furthermore, English I is a compulsory subject for upper secondary school students and the majority of $10^{\text {th }}$ graders use English I textbooks to develop their basic English abilities, as is directed by the government guidelines for foreign language teaching set by MEXT.

### 4.3.1. Pilot Study I-1: Same leveled six English I textbooks

Pilot Study I-1 (Koya, 2003b) intended to compare verb-noun collocations among six English I textbooks of the same level difficulty for Japanese upper secondary schools, and to examine how collocations for Japanese learners deviate from those which are frequently used by native speakers of English, which are exemplified in COBUILD.

The following research questions are set up:

1. Do English I textbooks have any general concept and consensus on what kinds of collocations should be taught?
2. Do English I textbooks have any general concept and consensus on how many collocations should be taught?
3. Do English I textbooks have any general concept and consensus on how collocations should be presented and taught in the textbooks?
4. Does the choice of collocations used in English I textbooks for Japanese upper secondary schools refer to the collocations which are frequently used in major corpora such as the Bank of English ${ }^{1}$ ?

Among some 50 English I textbooks, Create, Milestone, One World, Royal English, Sunshine, and Unicorn were chosen as these six textbooks were considered of the same level according to a survey by the textbook publishers.

Eighty target collocations were selected (see Table 11). The selected collocations were among combinations of 507 words recommended by MEXT to be taught at lower secondary schools with collocates which were common in all the selected textbooks. Whether they were regarded as collocations or not was determined in terms of COBUILD English Collocations on CD-ROM and the BBI Dictionary of English Word Combinations (Benson et

[^3]al., 1997). Especially, COBUILD English Collocations on CD-ROM was useful to know how frequently and widely the word combinations are used in the daily life of native speakers of English, because there were about 140,000 node/collocate pairs in the collection and about 2.6 million different examples and all examples are taken from the Bank of English, which is the largest bank of its kind in the world.

Table 11. Verb-noun collocations selected in Pilot Study I-1
break deadlock / bring end / bring peace / carry weight / catch breath / catch bus / catch eye / catch fire / catch glimpse / catch train / change mind / cut cost / cut price / cut rate / cut tax / do job / draw attention / draw conclusion / find job / find way / follow example / get call / get job / get rid / keep distance / keep eye / lose sight / lose weight / make call / make decision / make difference/ make face / make friend / make money / make sense / make use / make visit / make way / meet need / meet requirement / meet standard / pay visit / play part / play part / play role / put end / put money / put pressure / raise money / run business / run company / run country / set example / set fire / set record / set standard / solve problem / stand chance / stand trial / take account / take action / take advantage / take boat / take bus / take care / take holiday /take job / take look / take part / take pick / take picture / take place / take time / take turn / take vacation / take walk / take year / tell difference / turn attention

Collocations were analyzed by the means of TXTANA, a concordance software program and the results were as follows:
(a) Six English I textbooks had no consensus about which collocation should be taught.
(b) There were only a few collocations in the textbooks and there was not so much difference on the number of collocations among them.
(c) Each textbook had a different concept on which collocations were important and how they should be taught. (Some collocations were explicitly presented in some textbooks, but some were not.)
(d) Six English I textbooks followed the high frequency of use of collocations in the daily life of native speakers of English.

### 4.3.2. Pilot Study I-2: English I textbooks vs. English II textbooks

Pilot Study I-2 (Koya, 2004b) compares verb-noun collocations from four English I textbooks and four English II textbooks for Japanese upper secondary schools, and examines how the collocations in each textbook are treated. This is a follow-up to Pilot Study I-1 which revealed that the textbooks neglect a consideration of the fact that learners should develop their collocational knowledge in order to cultivate their communication ability. English II textbooks are used after English I textbooks and aim to further cultivate learners' comprehensive English ability. In other words, English II textbooks are expected to be more advanced in vocabulary, grammar, collocations, and the four skills (speaking, listening, reading and writing). Therefore, Pilot Study I-2 analyzes the treatment of collocations in both textbooks, following Pilot Study I-1.

Three research questions are postulated:

1. Do English II textbooks have any general concepts and a consensus on what kind of collocations and how many of them should be taught?
2. Does the choice of collocations used in English II textbooks for Japanese upper secondary schools refer to the collocations that are frequently used in major corpora such as the Bank of English?
3. Do English II textbooks have many collocations based on those presented in English I textbooks?

In order to compare English II textbooks with English I textbooks, English II textbooks by the same publishers were chosen: Creative, One

World, Royal English, and Sunshine.
Ninety-four target verb-noun collocations were selected (see Table 12). In order to do this, only verbs and nouns which commonly appeared in all the target textbooks were extracted and words connected with the common verbs or nouns in collocations were found, referring to COBUILD English Collocations on CD-ROM and the BBI Dictionary of English Word Combinations (Benson et al., 1997). The following are the 94 target verb-noun collocations.

Table 12. Verb-noun collocations selected in Pilot Study I-2
achieve success / attract attention / break deadlock / bring end / bring peace / carry weight / catch breath / catch bus / catch eye / catch fire / catch glimpse / catch train / catch train / change attitude / cut cost / cut price / cut rate / cut tax / draw attention / draw attention / draw conclusion / focus attention / get attention / get call / get idea / get rid / have conversation / improve image / keep eye / lose sight / lose weight / make appearance / make call / make contact / make conversation / make decision / make difference / make friend / make love / make money / make name / make progress / make sense / make success / make use / make visit / make way / meet need / meet requirement / meet standard / pay attention / pay visit / play part / play role / put end / put money / put pressure / raise money / reach agreement / reach final / reach point / reach stage / run business / run company / run country / set stage / show courage / stand chance / stand chance / stand trial / take account / take action / take advantage / take attitude / take boat / take bus / take care / take chance / take control / take hand / take holiday / take idea / take look / take part / take picture /take place / take time / take train / take turn / take vacation / take walk / take year / turn attention / turn attention

Collocations were analyzed by the means of TXTANA, a concordance software program and the results were as follows:
(a) The collocations as a whole were different with each of the four different English II textbooks.
(b) All the target textbooks paid little attention to collocations: Only a few were treated among them.
(c) The target textbooks did not refer much to the collocations which were frequently used in the Bank of English.
(d) Each collocation appeared only once or twice in the target textbooks.
(e) There was not so much difference between total number of collocations in English I and English II textbooks.
(f) None of the English II textbooks had a concept to build up the learners' collocational knowledge by repeating the use of selected collocations.

### 4.3.3. Pilot Study I-3: Revised English I textbooks vs. former English I textbooks

Pilot Study I-3 (Koya, 2004a) compares verb-noun collocations from four revised English I textbooks and four former English I textbooks for Japanese high school students and suggests an effective way of collocation teaching with the new textbooks in the classrooms.

This is a follow-up to Pilot Study I-1 and I-2, which revealed that collocations were depreciatingly treated in English I and II textbooks, namely, collocations were not presented repeatedly, nor presented in the order of frequency. In 2003, the new government guidelines for foreign language teaching to upper secondary school students was implemented to further develop active communicative ability with a limited vocabulary (see Chapter 1). Many English I textbooks were rewritten in response to the new guidelines so that students could use them in 2003, while the old edition of English II textbooks were still being used for $11^{\text {th }}$ graders at that time because the rewritten English II textbooks used after I textbooks would be used after 2004. Thus, in this study only the revised English I textbooks were examined to see if collocations were given more weight.

The following three research questions were set up.

1. What kind of collocations and how many are used in the revised English I textbooks?
2. How are the collocations presented in the textbooks?
3. What are the similarities and differences between collocations in the English I textbooks and their revised ones?

Targeted English I textbooks ${ }^{2}$ were Milestone English course I, One World English course I, Sunshine English course I and Unicorn English course I . They are of the same level and the top four in use.

One hundred nineteen target verb-noun collocations were selected. In order to specify them, the following steps were taken. First, transitive verbs and nouns which appeared in all the target textbooks were extracted by means of KWIC concordance. Second, considering nouns in those V-N combinations as nodes, all the collocates were selected from COBUILD English Collocations on CD-ROM, which resulted in 204 collocations. Third, after those 204 collocations were checked if they were listed as collocations in the BBI Dictionary of English Word Combinations (1997) and Oxford Collocations Dictionary for Students of English (2002)3, 105 collocations remained. Finally, 14 collocations that were listed in the glossaries in the

[^4]back of the respective textbooks were added to those 105 collocations, amounting to 119 collocations.

In order to answer research question 3, 37 collocations in the former
English I textbooks were added to the 119 collocations, resulting in total of
156 collocations, seen in Table 13.

Table 13 . Verb-noun collocations selected in Pilot Study I-3
achieve goal / ask question / break deadlock / build house / buy house / buy share / buy stock / carry weight / catch breath / catch bus / catch eye / catch fish / catch glimpse / catch train / change name / close eye / decide fate / deliver message / discuss issue / discuss matter / do research / draw line / eat food / face problem / find job / find way / follow example / follow path / get answer / get job / get message / get rid / give advice / give answer / give chance / give example / give information / give way / leave message / lose money / lose seat / lose sight / lose time / lose weight / make break / make change / make check / make decision / make difference / make face / make life / make love / make money / make point / make sense / make use / make way / meet requirement / meet standard / open door / open eye / play part / play role / produce result / put stop / raise money / reach point / read paper / receive message / receive support / receive treatment / see point / send letter / send message / send postcard / set example / set record / shed light / show talent / spend money / take account / take action / take advantage / take break / take care / take chance / take job / take look / take part / take place / take pleasure / take seat / take step / take time / take train / take turn / take walk / tell story / turn attention / win championship / win election / win game / win race / win seat / win title (give speech / lose temper / make call / make friend / make joke / make law / make mistake / make progress / make reservation / make speech / spend time / take pride / take picture / take test)[bring end / bring peace / catch breath / catch fire / change mind / cut cost / cut price / cut rate / cut tax / do job / draw attention / draw conclusion / get call / keep distance / keep eye / make visit / meet need / pay visit / put end /put money / put pressure / run business / run company / run country / set fire /set standard / solve problem / stand chance / stand trial / take boat / take bus / take holiday / take pick / take trip / take vacation / take years / tell difference]
( ) collocations listed in the glossary in the back of the targeted English I textbooks
[ ] collocations selected from the former textbooks

The results of analysis, by the means of TXTANA, are summarized as follows:
(a) All the target textbooks paid little attention to collocations: They treated few collocations.
(b) The target textbooks did not refer much to the collocations which were
frequently used in the Bank of English.
(c) Even collocations appearing in the textbooks were not repeated many times: Collocations were not treated from a pedagogical point of view.
(d) There was not so much difference of type, number and treatment of collocations between the former and the revised English I textbooks: Revised English I textbooks were not improved in terms of collocation.
(e) The collocations, as a whole, were different according to the former and revised four different English I textbooks.

### 4.3.4. Pilot Study I-4: History textbooks in the UK

Pilot Study I-4 (Koya, 2004c) extracts collocations from a history textbook for secondary school students used in the UK and compares them with those included in secondary school English textbooks in Japan. A UK history textbook was selected because it describes historical events and happenings in people's daily lives of the past in a natural phrases and collocations of native speakers of English unlike English language textbooks which focus on the language.

This research focused are the following four questions:

1. What kind of collocations are used in the history textbook?
2. How many collocations are used in the history textbook?
3. How often do the same collocations appear in the history textbook?
4. What are the differences between collocations in the UK history textbook and those in English textbooks in Japan?

Among many history textbooks used at different schools in the UK, the history textbook, Contrasts and Connections, was selected for the study for the following two reasons: it was a bestseller in the UK and it was compiled by the Schools Council ${ }^{4}$ as a project of UK National Curriculum. This book covers the Roman Empire, Medieval Realms and Islamic Civilizations, from 500 BC to AD 1500 and reconsiders the nature of history and its relevance in secondary schools.

To compare with Contrasts and Connections, selected were four textbooks: Milestone English course I, One World English course I, Sunshine English course I and Unicorn English course I. They were newly published in 2003, in accordance with the government's guidelines issued by MEXT.

In order to specify collocations used in Contrasts and Connections, the following steps were taken. First all the nouns which appeared in the textbook were extracted by means of World Smith, a KWIC concordance software program. Second, the nouns which appeared more than six times were chosen and were arranged in descending order from those with the highest frequency to the lowest, resulting in 515 nouns. Third, using these nouns as nodes, the collocates (verbs) were selected with reference to COBUILD English Collocations on CD-ROM (1995), Oxford Collocations Dictionary for Students of English (2002) and the BBI Dictionary of English Word Combinations (1997). One hundred seventy noun-verb combinations

[^5]were selected as collocations among these three dictionaries in order to answer the research questions 1 to 3 (see Table 14).

Table 14. Verb-noun collocations extracted from a history textbook in Pilot Study I-4

#### Abstract

achieve success / add spice / ascend throne / build bridge / build castle / build mosque / buy property / buy stock / catch eye / change subject / climb mountain / close door / commit crime / commit sin / create impression / cut tax / cut wood / deliver message / deny charge / develop skill / discuss matter / do business / do duty / draw map / drill hole / drink beer / drop charge / eat meal / employ tactics / end reign / erect statue / evade capture / exercise judgment / exert influence / express anger / express opinion / face charge / find evidence / find solution / find way / forgive sin / get answer / get impression / get job / get letter / get message / get permission / get picture / give advice / give answer / give birth / give evidence / give impression / give protection / hold meeting / impose sentence / improve condition / keep faith / launch attack / launch crusade / learn language / learn skill / leave mark / leave message / leave school / lock door / lock gate / lose faith / make advance / make contact / make copy / make decision / make difference / make dough / make face / make friend / make hole / make impression / make journey / make judgment / make list / make love / make mark / make meal / make mention / make money / make payment / make profit / make room / make rule / make sacrifice / make statement / make success / need skill / offer advice / offer protection / open door / open mouth / paint picture / pass judgment / pass law / pass sentence / pay rent / pay tax / play game / play part / pose threat / provide protection / publish book / put clock / put faith / raise money / raise tax / reach stage / receive letter / receive payment / resolve difference / run race / run riot / send letter / send message / set example / set record / set scene / set stage / shake head / shoot arrow / show loyalty / show mercy / sign document / speak language / spend money / spend night / spend time / stand trial / take action / take advantage / take advice / take attitude / take bath / take boat / take care / take charge / take course / take decision / take effect / take hand / take medicine / take part / take picture / take place / take position / take possession / take time / take view / take walk / tell difference / tell tale / toss coin / turn eye / turn head / use influence / use language / use method / use tactics / waste time / win game / win race / win victory / write letter

In order to answer research question 4, collocations were selected in the following steps from the four English I textbooks in Japan. First, transitive verbs and nouns which appeared in the target textbooks were extracted by means of a KWIC concordance. Second, considering them as nodes, the collocates were selected from COBUILD English Collocations on CD-ROM (1995), resulting in 204 collocations. Third, by deleting those which were not listed in both the BBI Dictionary of English Word Combinations (1997) and Oxford Collocations Dictionary for Students of English (2002), 105
collocations remained. Finally, 15 collocations listed in the glossaries of the respective textbooks were added, making the total of 120 collocations (see Table 15).

Table 15. Verb-noun collocations extracted from English I textbooks in Pilot Study I-4
achieve goal / ask question / break deadlock / build house / buy house / buy share / buy stock / carry weight / catch breath / catch bus / catch eye / catch fish / catch glimpse / catch train / change name / close eye / decide fate / deliver message / discuss issue / discuss matter / do research / draw line / eat food / face problem / find job / find way / follow example / follow path / get answer / get job / get message / get rid / give advice / give answer / give chance / give example / give information / give way / leave message / lose money / lose seat / lose sight / lose time / lose weight / make break / make change / make check / make decision / make difference / make face / make life / make love / make money / make point / make sense / make use / make way / meet requirement / meet standard / open door / open eye / play part / play role / produce result / put stop / raise money / reach point / read paper / receive message / receive support / receive treatment / see point / send letter / send message / send postcard / set example / set record / shed light / show talent / spend money / take account / take action / take advantage / take break / take care / take chance / take job / take look / take part / take place / take pleasure / take seat / take step / take time / take train / take turn / take walk / tell story / turn attention / win championship / win election / win game / win race / win seat / win title (give speech / lose temper / make call / make friend / make joke / make law / make mistake / make progress / make reservation / make speech / spend time / take picture / take pride / take test / take trip)
( ) collocations listed in the glossaries in the back of the targeted English I textbooks

The result of analysis by the means of TXTANA were as follows:
(a) The history textbook in the UK included such collocations as play part, make money, and give birth which were used in the present daily life in the UK and which were common in the Japanese English I textbooks.
(b) Some unique collocations, build castle, launch crusade, and use tactics were found to be related to events in world history.
(c) Collocations appearing in the textbooks in Japan were not repeated many times: more than half were repeated only once.
(d) The number of collocations appeared in the UK history textbook and the Japanese English I textbooks was almost the same.
(e) Collocations in the UK history textbook were a half of those in the English I textbooks, perhaps because objects such as train and bus did not exist in the periods covered in the history textbook.

### 4.3.5. Summary of the four pilot studies

The results of the four pilot studies on collocation were summarized as follows:
(a) Collocations were little focused on in English textbooks for upper secondary school students in Japan.

According to Pilot Studies I-1, I-2 and I-3, only a few collocations were treated in all the examined English textbooks (revised and former English I textbooks and former English II textbooks). In short, English textbooks for upper secondary school students paid little attention to collocations.
(b) English textbooks for upper secondary school students had no concept and no consensus on how basic collocations should be taught.

Pilot Studies I-1, I-2 and I-3 found that there was much difference in type, number and treatment of collocations among the former English I textbooks, among the revised English I textbooks, and among the former English II textbooks. Although it was explicitly written in the government guidelines for foreign language teaching that basic collocations should be taught, no textbooks examined had clear ideas of them.
(c) English textbooks for upper secondary school students lack pedagogical consideration regarding collocations.

The result of Pilot Studies I-2 and I-3 showed that collocations occurring in each textbook were not repeated. Pilot Study I-3 also revealed that collocation grading was not taken into consideration in compiling English I and English II textbooks. Therefore, in terms of collocations English textbooks for secondary school students were not appropriate to facilitate the students' effective learning.
(d) It was not confirmed whether collocations appearing in English textbooks for Japanese upper secondary school students coincided with the high-frequency collocations in the Bank of English.

While Pilot Study I-1 proved that some collocations found in six English I textbooks in Japan were the same as those in the Bank of English, Pilot Studies I-2 and I-3 showed the opposite: The target textbooks did not refer much to the collocations which are frequently used in Bank of English. Further research should be conducted to confirm these results.
(e) Some collocations were used in both the Japanese English I textbooks and the UK history textbook, while some topic-oriented collocations occurred only in the history textbook.

Pilot study I-4 showed that some collocations such as play part and give birth were common in the history textbook and English I textbooks, although the tokens and the types of words were different between them and some unique collocations such as build castle and launch crusade were
used in the history textbook. There was possibility that some common collocations were frequently used regardless of topics in textbooks of different genres (such as the history textbook and English I textbooks in Pilot Study I-4), but that will be investigated in the next chapter.

### 4.3.6. New research questions raised by the four pilot studies

After the four pilot studies revealed the present states of the poor collocation treatment in English textbooks for upper secondary school students, the following limitations were recognized:

1. Collocation dictionaries were used to analyze the status quo of collocations used by native speakers of English, but we would need to access a large corpus of native speakers of English in order to identify basic collocations for Japanese learners of English.
2. To select target collocations only several textbooks and collocation dictionaries were used. We would need to refer to some word lists necessary for Japanese learners of English and access a large corpus of native speakers of English in order to identify basic collocations for Japanese learners of English.
3. Only the reality of collocation treatment in Japan was investigated. We should examine features of high-frequency collocations used by native speakers of English in order to identify basic collocations for Japanese learners of English.

These limitations are related to methodological concerns of collocational study. To improve these insufficient methods, more systematic research
with a large corpus and word lists are needed to answer main question, "What are basic collocations?"

Furthermore, the last limitation, a reference to the reality of collocation use by native speakers of English, is especially important. This is because collocation is strongly related to culture and collocations have cultural connotations according to McCarthy (2004, August). He mentions that, because of the connotative features, collocations are regarded as right or wrong by native speakers of English and the clarification of the mechanism has been tackled by few researchers. Dromou referred by McCarthy (2004, August) conducted a survey on the reaction of native speakers of English to collocations produced by non-native speakers of English. The finding was that native speakers of English never accepted those collocations when they were introduced as non-native speakers'. This shows that native speakers of English take only their collocations to be acceptable and only they can create collocations. Crystal (1992) also defines collocational competence as one which only native speakers can establish or confirm.

Some researchers criticize corpus study because corpus is an incomplete and lopsided record of fact. Cook (2003, pp. 104-111), for example, lists several reasons to support this idea. One is that even the largest corpora of English are still smaller than the average adult user's experience of the language. The second is that many English corpora are dominated only by native speakers of English, who are considered to be real and authentic language users. The third is that corpus contains information about production but not about reception. The final one is that although corpus linguists are fond of observing the commonest uses of words which are not the same as their standard definitions, they do not reflect them in their
dictionary. For example, the suppose meaning of $I$ bet is used more frequently than the wager meaning of it, but the latter is still given as the first meaning of bet in the COBUILD dictionary.

Although some shortcomings of corpus study should be taken into consideration, the present writer recognizes that it is useful in collocation study because of collocation features and no alternative ways other than it. This research takes examining the reality of collocation use by native speakers of English in a corpus to be a first step which leads to the answer to "what are basic collocations for Japanese learners of English?"

Then, some new research questions have brought up the following:
"What are basic collocations?"

1. What are high-frequency collocations in large corpora collected from native speakers of English?
2. What are features of those high-frequency collocations by native speakers of English?

2a. Which levels of words are included in the high-frequency verb-noun collocations, in the word list of basic words for Japanese learners of English?

2b. Are high-frequency collocations of native-speaker English related to topics?
3. How are collocations presented in English textbooks for upper secondary school students in Japan deviated from those of native-speaker English?

### 4.4. Pilot Study II: Empirical research

There has been a lot of empirical research to clarify learners' mechanism
of collocation acquisition as were referred in Chapter 3. Some research has been carried out by contrastive analysis between L1 and L2 and they stress the influence of L1 on the acquisition and the use of collocations (Bahns and Eldaw 1993, Biskup 1992, Caroli 1998, Eldaw 1993, Granger 1998, Nesselhauf 2003). In other research, the findings showed not only L1 negative transfer but some other factors such as overgeneralization and inadequate instruction learners receive (Blum and Levenston 1978, Dechert and Lennon 1989, Elyildirm 1997, Fayez-Hussein 1990, Gitsaki 1999, Kellerman 1979, Lennon 1996). These researchers assume that learners need to develop collocational competence in order to gain overall English proficiency. In Japan, however, there has been little empirical collocation research conducted to date. None of the collocation acquisition by Japanese learners of English have been clarified, although more Japanese researchers have accepted the importance of learners' collocation acquisition. Therefore, a pilot study was conducted on collocation acquisition by Japanese learners of English.

### 4.4.1. Pilot Study II-1

Pilot Study II-1 (Koya, 2003a) examines the process of productive and receptive collocation acquisition at different stages of language learning and factors influencing the process by focusing on verb-noun combinations as is mentioned in 4.3. In order to conduct a survey on collocations, three specific research questions were raised as follows:

1. What developments occur in learners' productive and receptive knowledge of collocations and in their vocabulary size at different stages
of language learning? (How are collocational knowledge and general vocabulary knowledge related to one another in the same individual? Will the learners' collocational knowledge expand at the same rate as their knowledge of vocabulary in general?)
2. How are the receptive and the productive knowledge of collocations acquired with regard to different types of collocations (directly and non-directly translated collocations) at different stages of language learning (different levels of vocabulary)? Is the different extent of the acquisition related to L1 features in selecting possible collocations for a given L2 node at different stages of L2 learning?
3. How important is collocational knowledge for Japanese learners of English in the acquisition of English communication skills? (In view of the creative potential of language, is it not usually possible to paraphrase one's way around the tricky terrain of collocations?)

The subjects were 93 first-year university students in Japan. They had received classroom instruction in EFL for a period of at least six years. The first language of all the students was Japanese.

Three kinds of tests were carried out: a general vocabulary test, a productive collocation test, and a receptive collocation test. For the general vocabulary, the Vocabulary Levels Test designed by Nation (1990) was used. The 93 subjects were divided into three groups as is given in Table 16.

Table 16. Three groups of subjects

| Categorization | Explanation of each group | No. of subjects |
| :---: | :---: | :---: |
| 1000 word level group | students whose score is less than 12 at 2000 level test | 30 |
| 2000 word level group | students whose score is less than 12 at 3000 level test | 30 |
| 3000 word level group | students whose score is less than 12 at 5000 level test | 33 |

The productive collocation test which the present researcher devised used 26 target collocations of verb-noun combinations which were selected from The Crown I textbook and which were checked if they are included in the BBI Dictionary of English Word Combinations (Benson et al., 1997) and COBUILD English Collocations on CD-ROM (1995), and if they are accepted by three native speakers of English from the US who are teaching English at some universities in Japan. The 26 collocations were divided into two groups to see influence by L1: 13 collocations which have Japanese equivalents and 13 collocations which do not have direct translations from English into Japanese as is shown in Table 17.

Table 17. Selected collocations (a) with a Japanese equivalent and (b) without a Japanese equivalent

| (a) collocations with a Japanese equivalent | (b) collocations without Japanese equivalent |
| :---: | :---: |
| break the law | make every effort |
| break one's promise | eat soup |
| lose heart | do harm |
| take a vacation | keep one's promise |
| win a contest | make a speech |
| do one's homework | set a good example |
| pass the exam | take a walk |
| pay tax | take medicine |
| make money | keep a diary |
| do business | make mistakes |
| open one's eyes | make some progress |
| save the life | make a copy |
| play cards | make no difference |

The productive collocation test is a translation task into English of 26 Japanese sentences, which include selected collocations. Words in the sentences are limited to the basic 700 words for lower secondary school students listed by MEXT.

The receptive collocation test used the same collocations in the productive collocation test. The test format was multiple-choice and 26 sentences were prepared, in which the missing main node was to be provided by the subjects. There were three choices in each question and all of the distracters were synonymous words from a dictionary of English synonyms and antonyms and checked with the BBI Dictionary of English Word Combinations (1997) to make sure they were not a collocational combination. The students were asked to choose the answer which they thought was right from the three choices.

As for the procedure, 93 subjects took these three kinds of tests during a regular class. The Vocabulary Levels Test and the productive collocation test lasted for 40 minutes and the receptive collocation test for 20 minutes. The students were not allowed to use any dictionaries to check the meaning of words. Moreover, they were not informed about the true purpose of the three tests, but were simply told that their vocabulary proficiency would be tested. After finishing all the tests, the answer sheets were distributed to students, because it was felt that they should learn their results from an educational perspective.

The data from the three kinds of tests were marked according to two scoring criteria: a binary criterion and a degree criterion. A binary criterion was applied to the Vocabulary Levels Test and the receptive collocation test and the items were simply scored as correct or incorrect, because both the tests have a multiple-choice format. A degree criterion was applied to the productive collocation test because it is a translation task and a variety of answers was expected. 26 sentences including 26 collocations were rated with the following marks:
$0=$ incorrect answers
$1=$ correct answers, which include expected collocations in the sentences
$2=$ correct answers which did not include expected collocations in the sentences, but which were regarded as acceptable ones

3 = blank
$4=$ incorrect answers, which are affected by L1 ${ }^{5}$

The answers given by the subjects were checked with the BBI Dictionary of English Word Combinations (1997) and then evaluated by three native speakers of English of the US.

The data gathered from the subjects' completion of the three kinds of tests were submitted to statistical analysis. SPSS, a statistical software tool, was used in order to analyze all the data. The results analyzed by means of SPSS can be summarized for each question as follows:
(a) Research question 1:

As predicted in research question 1, the tests proved that the more vocabulary knowledge learners had, the more collocational knowledge in both production and reception were acquired. In other words, there was a close correlation between the learners' general vocabulary knowledge and the collocational knowledge.
(b) Research question 2:

The learners' vocabulary became richer, as more receptive and productive knowledge of collocations including both direct and non-direct

[^6]translations were acquired. Considering the influence from L1 negative transfer, higher level students tended to resort to L1 in selecting possible collocations for a given L2 node, which was the opposite of what previous research (Caroli, 1998) and we expected. This result is related to another result that lower level students much more easily gave up producing sentences when they did not know some words or verb-noun combinations
(c) Research question 3:

It seemed to be very difficult for any level student to paraphrase or describe answers with synonymous words when they did not know the target collocations. Moreover, they preferred refraining from giving any answer that might be a mistake. It could be said that they were reluctant to take risks.

### 4.4.2. New research question raised by Pilot Study II

After the Pilot Study II-1 was conducted in order to examine the mechanism of the development of collocational knowledge of Japanese learners of English, it was found that the Vocabulary Levels Test, the selected collocations, and the division of the selected collocations need to be further specified to make them more reliable.

Nation's Vocabulary Levels Test was used to group the subjects based on their vocabulary levels. This was because the test had proved to be a sufficiently useful and reliable diagnostic tool by Laufer (1992) and Read (1988). However, Nation's test was revised into a more suitable one for

Japanese learners of English by Mochizuki (1998) ${ }^{6}$ and it has proved to be a more reliable test by some validity tests. In order to get a more dependable score, Mochizuki's test should be used.

The 26 target collocations were selected from one of English textbooks for $10^{\text {th }}$ graders, the Crown I textbook ${ }^{7}$. This means that they were not studied by all the subjects. This is because any textbook can be selected by teachers at different schools among many textbooks authorized by MEXT and there is a great difference of type, number and treatment of collocations between textbooks. In order to improve these inadequate factors, basic collocations whose constituents are basic words expected to be learned by secondary school students should be identified and targeted.

The 26 target collocations were divided into two in terms of whether they have a Japanese equivalent or not. This is one of many perspectives to analyze collocations and other norms were pointed out by Blum and Levenston (1978), Dechert and Lennon (1989), Elyildirm (1997), Farghal and obidedat (1995), Fayez-Hussein (1990), Gitsaki (1999), Kellerman (1979), and Lennon (1996). They were mainly shortage of general vocabulary knowledge, L1 negative transfer, semantic transparency of collocations, collocational restriction, core meaning of verbs, unfamiliarity of collocational structure and they should be taken into consideration in order to conduct more detailed and meticulous research.

In the consideration of the improvements of Pilot Study II-1 written above, the following new research questions were added: What influences learners' collocational knowledge? Shortage of general vocabulary

[^7]knowledge, L1 equivalence, semantic transparency of collocations, collocational restriction, core meanings, collocational structure?

## Chapter 5. <br> Methodology: Phase I. Corpus-based research

### 5.1. Introduction

This chapter examines high frequency collocations of native speakers of English in means of native English corpora to identify basic and important collocations which Japanese secondary school students are to learn.

The first section mentions the purpose of this research and sets up research questions. The second section refers to three corpora used in this research - the British National Corpus, the TIME corpus and the English I textbook corpus - and discusses why they were selected. The third section presents a selection of basic nouns to be learned by Japanese learners of English by using one word list, the JACET List of 8000 Basic Words (2003) and a selection of verbs to be collocated with the nouns, by using four collocation dictionaries: COBUILD English Collocations on CD-ROM (1995), Oxford Collocations Dictionary for Students of English (2002), the BBI Dictionary of English Word Combinations (1997) and The Kenkyusha Dictionary of English Collocations (1995). The final section of the chapter demonstrates the procedure of this research.

### 5.2. Purpose and research questions

The purpose of this research is (a) to examine which collocations are frequently used by native speakers of English in order to answer the research question, "What are the basic collocations?" and (b) to investigate what collocations occur in English textbooks for secondary school students in Japan and how they are deviated from the high frequency collocations by
native speakers of English. Identifying the reality of usage of collocations by native speakers of English is the first step in collocation study, which leads to the selection of collocations to be learned by Japanese learners of English in terms of their purpose of learning English (see section 4.3.6.).

Japanese secondary school students learn English to develop general English ability, not English for specific purposes, focusing on practical communication ability and to foster a positive attitude toward communication through English. In order to develop general communicative ability, the acquisition of basic collocations is prerequisite and it is supported by Alexander (1984), Ellis (2001), Korosadowicz-Struzynska (1980), Lewis (1993, 2000), Hill (2000), McCarthy (1984), Nattinger and DeCarrico (1992), Pawley and Syder (1983), Yorio (1980) (see section 2.4.).

This chapter presents a larger scale research of the four pilot studies. More precise methodology was adopted, more carefully selected collocations were used and a larger corpus of samples of native-speaker English was used to analyze the treatment of collocations in English textbooks for secondary school students.

For this study, four research questions were set up:
"What are basic collocations?"

1. What are high-frequency collocations in large corpora collected from native speakers of English?
2. What are features of those high-frequency collocations by native speakers of English?

2a. Which levels of words are included in the high-frequency verb-noun collocations, in the word list of basic words for Japanese learners of

English?
2b. Are high-frequency collocations of native-speaker English related to topics?
3. How are collocations presented in English textbooks for upper secondary school students in Japan deviated from those of native-speaker English?

### 5.3. Material: Corpus

Three corpora were used to examine high-frequency collocations of native-speaker English and those in English textbooks for Japanese upper secondary school students.

### 5.3.1. British National Corpus (BNC)

The British National Corpus (BNC) was selected in order to extract target collocations. It is one of the largest monolingual British English corpora in the world, containing some 100 million sample words of both written and spoken English. The reason this corpus was selected was that the whole text was easily obtained, via computer access and it had three main outstanding features as follow:

## 1. The BNC comprises 100,106,008 words of present-day English.

It comprises about 100 million British English words of the late 20 ${ }^{\text {th }}$ century, reflecting the present daily use of the language. In fact, all imaginative texts are dated no earlier than 1960, all informative texts 1975 and all spoken texts 1991. As a whole, a large majority of BNC texts are dated from the period 1985-1994.

## 2. The BNC contains a wide range of both spoken and written British

## English.

It contains spoken text (10\%) and written text (90\%). The spoken text was extracted from a large amount of unscripted informal conversation, recorded by volunteers selected from different ages, regions and social classes in all kinds of different contexts, covering from formal government meetings to radio shows and sports commentaries. On the other hand, written texts were extracted from writings by all ages and for all interests academic books and popular fiction, published and unpublished letters and memoranda, school and university essays, and other kinds. Although spoken text and written text are unbalanced, the BNC itself claims that it is a balanced corpus of daily language use, because it covers a large variety of texts.
3. The tagging of the BNC is carried out with a version of the CLAWs, a stochastic part-of-speech tagger developed at the university of

## Lancaster.

All the 4,124 texts of the BNC are segmented into six and a quarter million sentence units, of which parts of speech are all classified by the CLAWs, automatic tagging software (Garside \& Smith, 1997) and Template Tagger (Fligelstone, Rayson \& Smith, 1996), using a set of 134 detailed part-of-speech dictionaries. The classification scheme used for the corpus differentiates some 65 parts of speech, which are described in the accompanying documentation. Therefore, with SGML Aware Retrieval Application (SARA), a concordance software program, it is easy to search
rapidly through the BNC for examples of specific words and the high-frequency combinations and so forth, which can be sorted and displayed in a variety of different formats.

Thus, the BNC reflects samples of British English used by thousands of British people.

### 5.3.2. Making the TIME corpus

TIME (American edition) was also selected as a written English database of native speakers of English in order to extract target collocations. This weekly magazine has one of the largest circulations in the world and an audience of more than 300 million around the world. It also covers many kinds of topical news such as world, science \& technology, art \& entertainment, and it attracts many readers. As the English language used in TIME is regarded as the standard North American English, the TIME corpus offers the standard North American English collocations, while the BNC provides the standard British English collocations.

English of 17 volumes, December 1 in 2003 to March 29 in 2004, of TIME were collected and computerized into one large corpus. Two methods, an optical character reader and keyboarding were used to process the selected TIME English onto the computer.

As the data was in printed form, the optical reader was used to store the majority of the data on the computer. Advertisement parts and pages were omitted because they were not relevant for this collocation research. The size of the TIME corpus results is shown in Table 18.

Table 18. Tokens and types in TIME

| TIME |  |
| :---: | :---: |
| (from December 1 in 2003 to March 29 in 2004, total 17-volumes) |  |
| Total tokens | 453117 words |
| Total types | 36099 words |

Because TIME has more than 20 categories, the corpus was recategorized into main topics and subordinate topics as in Table 19 below:

Table 19. Four main categories

| Main topics | Subordinate topics |
| :---: | :--- |
| Social science | Nation, World, Business, Society, Crime, Religion, Education |
| Science \& Technology | Medicine, Space, Time in Depth, Health, Technology, Environment |
| Art \& Entertainment | Book, Theater, Movie, Music, Television, Sports |
|  <br> opinions) | Essays, Interviews, Letters, Notebook, People, Your time, Life style, <br> Viewpoints |

### 5.3.3. Making the English I textbook corpus

English I textbooks for Japanese $10^{\text {th }}$ graders were chosen for this investigation. The reason they were selected is related to the purpose and role of English I classes. According to the government guidelines for foreign language teaching, English I and Oral Communication I are obligatory and both of them are required to teach at secondary schools with the MEXT-authorized English I textbooks and Oral Communication I textbooks. English I textbooks are more appropriate for this study because they aim at the overall development for the basic skills (speaking, listening, reading and writing), while Oral Communication I focuses on spoken English ability.

English I textbooks are edited to develop students' basic abilities to comprehend what they listen to or read and to convey information and ideas by speaking and writing. According to the latest government guidelines for
foreign language teaching published by MEXT, words $10^{\text {th }}$ graders are expected to learn is 1300, compared with 1400 in the former guidelines implemented in 1989-2002.

Among the many textbooks approved by MEXT, four textbooks Milestone English course I, One World English course I, Sunshine English course I and Unicorn English course I were selected in that they are the top four sellers at schools and found to be of the same level. The English language used in these four English I textbooks was computerized in the same way as that in TIME. The total tokens and types are shown in Table 20 below:

Table 20. Tokens and types in four English I textbooks

| Targeted four English I textbooks |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Unicorn I | Milestone I | Sunshine I | One World I |
| Total tokens | 7910 | 7144 | 5978 | 6290 |
| Total types | 1627 | 1509 | 1394 | 1399 |

### 5.4. Selection of collocations

In this analysis, verb-noun collocations were targeted because they are most frequently used combinations, are regarded as key combinations in producing clauses and sentences, and they are the most often selected in the previous empirical research (Bahns and eldaw, 1993; Caroli, 1998; Nesselhauf, 2003).

In specifying verb-noun collocations which are used in the BNC, TIME and English I textbook corpora, we used one word list needed for Japanese learners of English the JACET List of 8000 Basic Words (2003)(JACET 8000), and four collocation dictionaries, COBUILD English Collocations on CD-ROM (1995), Oxford Collocations Dictionary for Students of English (2002), the BBI Dictionary of English Word Combinations (1997) and The

Kenkyusha Dictionary of English Collocations (1995).
$J A C E T 8000$ is a latest word list combining the scientific viewpoint and the educational viewpoint. It not only refers to the rank of words calculated from the data of the BNC and a set of various sub corpora, such as a TOFEL corpus and a science magazine corpus, but also modifies the rank of words by examining how they are used in school textbooks. The word list made in this way consists of the basic 8000 words for Japanese learners of English and is ranked from the first 1000 basic words (Level 1) to the 7001-8000 words (Level 8). This scientific and educational word list is important to choose basic collocations for Japanese learners of English, because they have to consist of basic words for them. Therefore, all the nouns listed in this word list were extracted, amounting to 4986 nouns.

All the verbs collocated with the selected 4986 nouns in JACET 8000 were checked if they were included in the four collocation dictionaries, resulting in 1572 collocations (Appendix A). The reason these four collocation dictionaries were used in this analysis is that they were the most representative collocation dictionaries, whether they were corpus-based or non corpus-based dictionaries. COBUILD English Collocations on CD-ROM (1995) and Oxford Collocations Dictionary for Students of English are corpus-based dictionaries (2002), with examples taken from the Bank of English, which shows high frequent word combinations used in the daily life of native speakers of English. The BBI Dictionary of English Word Combinations (1997) is however, based on the native speakers' intuition, and is not corpus-based. The Kenkyusha Dictionary of English Collocations (1995) has been one of the major collocation dictionaries in Japan since it was first published in 1939 and the present edition contains 380,000 word
combinations. Thus, these four dictionaries were used in order to select well-balanced collocations based on both corpus and the intuition of native speakers of English.

Table 21 shows the levels of nouns extracted from JACET 8000 and levels of verbs picked up from the four collocation dictionaries.

Table 21. Levels of nouns and verbs according to JACET 8000

| Node's level | Collocate's level | No. in each level | Node's level | Collocate's level | No. in each level |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 5.5. Procedure

First, the BNC was installed in my computer, then the TIME corpus and the English I textbook corpus were completed, and a selection of targeted collocations was finished. Then, whether the target collocations occurred in these three corpora was examined. As for span size, four words on either side of node are considered appropriate in this investigation, following previous research by Berry-Roghe (1973) and Jones and Sinclair (1974)(see section 2.3.3).

Collocations in the BNC were retrieved with SARA concordance software. Examination of the frequency of collocates for given nodes was conducted by using a collocation dialog box in SARA. In addition to the frequency check of the target collocations, the z-score was used, which is one of the most reliable statistical measures in calculating the strength of combinations between nodes and collocates within a certain span. The figure shows that the higher the z-score is, the more significant the clustering is. According to Barnbrook (1996), more than a three z -score is significant as a collocation.

Target collocations in the TIME corpus and the English I textbook corpus were retrieved with TXTANA, a concordance software, to show whether a keyword collocates with certain other words within a certain span of context in a set-up corpus. In addition to the lemmatized forms of target verb-noun collocations (e.g. make mistake), infinitive and -ing forms of verbs (e.g. to make a mistake and making a mistake), and plural forms of nouns (e.g. make mistakes) were shown as occurrences of the related types of combinations in the TIME corpus and the English I textbook corpus. Checking the context where target collocations occur and deleting inappropriate examples that target node and the collocate occur in different sentences in reference to
z-scores, the search for 1572 target nodes and the collocates was carried out.
The procedure is summarized in Table 22.

Table 22. Procedure of the corpus-based research

| Step 1 | Install the BNC and make the TIME corpus and the English I textbook corpus |
| :--- | :--- |
| Step 2 | Select target verb-noun collocations among verb-noun combinations |
|  | (1) <br> (2) |
| Extract all the nouns from JACET 8000 (No. of nouns = 4987) |  |
| Find verbs collocated with 4967 nouns in four collocation dictionaries |  |
| (No. of verb-noun collocations = 1572) |  |

## Chapter 6. Result and discussion Phase I. Corpus-based research

### 6.1. Introduction

This chapter identifies basic collocations for Japanese learners of English. In order to do so, frequency collocations by native speakers of English are referred to and how collocations in English I textbooks are deviated from a standard of native-speaker collocation is analyzed. The source is the BNC, the TIME corpus and English I textbook corpus. The first section analyzes selected collocations in the BNC as the standard Britain English and those in the TIME corpus as the standard North American English. It then examines the treatment of collocations in the English I textbook corpus for $10^{\text {th }}$ graders in Japan in terms of collocations of native-speaker English in order to identify what collocations would be basic for Japanese learners of English at the early stage.

The second section discusses how the above corpora analysis should be interpreted and what collocations should be selected for Japanese learners of English to develop a better command of English from pedagogical perspective.

### 6.2. Results

### 6.2.1. Analysis of the BNC

SARA, a concordance software, was used to calculate the frequency of 1572 target collocations in the BNC and the z-score per collocation. As is seen in Table 23, V-N combinations regarded as collocations were 1502 in the BNC as the z-score of $70 \mathrm{~V}-\mathrm{N}$ combinations is under three ( $<3.0$ ), indicating
that the combinations are clustered weakly and they are not judged as collocations by Berry-Rogghe (1973) and Bahnbrook (1996). Berry-Rogghe claims that for a collocation to be statistically significant at the one per cent level, the z-score should be at least 2.576. Bahnbrook also has almost the same opinion that a useful cut-off measure for significance in a z-score test is around three, so that the word combinations under three should not be interpreted as collocations. According to these two papers, 1502 V-N combinations were considered as collocations in the BNC.

Selected target collocations were checked not only with two corpus-based collocation dictionaries, but also with two native speakers' intuition based collocation dictionaries, because collocations are closely related to the culture where the language is used.

Table 23. Number of V-N collocations in the BNC

| z-score under $3.0(<3.0)$ | 70 |
| :---: | :---: |
| (including no frequency collocations) | 9 |
| No. of V-N collocations in the BNC | 1502 |

Table 24 shows frequency of 1502 collocations in the BNC and the levels of nodes and collocates per 100 collocations. Level 1 (L1) means the node and the collocate of a collocation consist of the first 1000 basic words in accordance with JACET 8000 (2003). In cases where either the node or the collocate of a collocation is found the higher levels, they belong to that level. For example, when a collocation consists of L1 node and level 2 (L2) collocate, it is regarded as L2 collocation, because an individual who knows more than 2000 words is most likely to understand and produce L1 node and L2 collocations.

Table 24. Level of the nodes and collocates per 100 collocations in the BNC

| BNC |  | L1 | L2 | L3 | L4 | L5 | L6 | L7 | L8 | TOTAL | L1+L2 |

|  |  | 7.8 | 12.5 | 9.4 | 6.3 | 18.8 | 15.6 | 21.9 | 7.8 | 100.0 |  |

$\mathrm{L}=$ Level

As is seen in Table 24, 78.0\% of collocations consisted of L1 nodes and collocates in the first 100 high-frequency collocations, after which the proportion of L1 nodes and collocates was steadily reduced: to $56.0 \%$ in the second 100 high-frequency collocations, to $42.0 \%$ in the third, to $39.0 \%$ in the
fourth and so on. For L1 and L2 nodes and collocates, which are subject to be acquired by the Japanese twelfth graders, the first 100 high-frequency collocations made up 98.0 \% and then the proportion of L1 and L2 nodes and collocates slightly decreased. In other words, the higher the frequency of collocations was, the more basic words might be comprised in the collocations, which leads to the observation that high-frequency collocations in the BNC consist of basic level verbs and nouns. These collocations are to be learned before entering universities.

### 6.2.2. Analysis of the TIME corpus

TXTANA, another concordance software, was used to calculate the frequency of 1572 target collocations in the TIME corpus (see Appendix B). Table 25 shows that 581 out of 1572 target collocations occurred in it. About a third of targeted collocations appeared and especially the number of type of collocates was limited.

Table 25. Number of collocations appearing in the TIME corpus

|  | No. |
| :--- | :---: |
| Noun (type) | 466 |
| Verb (type) | 180 |
| TOTAL COLLOCATIONS | $581(/ 1572)$ |

A few collocates were used quite often among the collocations appearing in the TIME corpus (see Table 26). It was found that make was the most frequently used collocate which occurs as collocation and take was the second most frequently used one, which was much more often used than other collocates.

Table 26. High-frequency collocates in collocations in the TIME corpus (five times or more)

| Frequency | Collocates |
| :---: | :--- |
| 75 | make |
| 60 | take |
| 24 | give |
| 19 | get |
| 12 | do |
| 11 | win |
| 10 | pay |
| 9 | hold, keep, play |
| 8 | have |
| 7 | cause, use |
| 6 | provide, set |
| 5 | commit, conduct, express, find, follow, lose, open, raise, send, show, suffer, <br> tell, write |

Table 27 shows collocations which were used 10 times or more in the TIME corpus. They indicate that the number of high-frequency collocations is limited, in fact, only 31 collocations were used more than 10 times in the TIME corpus.

Table 27. High-frequency collocations in the TIME corpus (10 times or more)

| Frequency of collocations | Collocations |
| :--- | :--- |
| 45 | do thing |
| 39 | play role |
| 24 | do job |
| 23 | do work |
| 21 | find way |
| 19 | have sex, tell story, have trouble |
| 18 | ask question |
| 17 | take place |
| 16 | make decision, make sense |
| 15 | pay attention, have effect |
| 14 | lose job, make mistake, write song, take time, fight war |
| 13 | play game, raise money |
| 12 | take care, make choice, open door |
| 11 | use force, answer question, take step |
| 10 | send message, make money, make movie, take risk |

$\mathrm{L}=$ Level

A look at the frequency of collocations appearing in the TIME corpus and the level of the make-up of nouns and verbs revealed the importance of L1
and L2 words in collocations occurring in the TIME corpus, (see Table 28 and Figure 5). Table 28 shows that $95.6 \%$ of collocations appearing more than seven times consisted of L1 verbs and nouns, while those which consist of both L1 and L2 verbs and nouns reached $100 \%$. Thereafter, the percentage of the L1 ratio of collocations became lower, however, seen in the ratio of collocations which consist of both L1 and L2, more than $80 \%$ of the collocations were made up of L1 and L2 verbs and nouns. The data reveal that high-frequency collocations in the TIME corpus consist of basic and simple-leveled words.

### 6.2.3. Features of collocations in the BNC and the TIME corpus

A comparison of high-frequency collocations in the BNC and the TIME Corpus brought two findings. The first is that high-frequency collocations were common in both corpora. Table 29 shows collocations which are frequently used in the TIME corpus and which are ranked within 100 in the BNC. Among 31 collocations which occurred 10 times or more in the TIME corpus, 25 collocations belonged to the 100 most frequent collocations in the BNC. Thus, common high-frequency collocations in the BNC and the TIME corpus were ranked within 100 in this analysis.

As is seen in Table 30, among six collocations which occurred 10 times or more in the TIME corpus, have sex is not regarded as a collocational combination in the BNC, because the z-score is 2.5 , which is under the three needed as a collocational combination. In the other six collocations, send message is ranked $175^{\text {th }}$, fight war $275^{\text {th }}$, write song $352^{\text {nd }}$, use force $352^{\text {nd }}$, and make movie $590^{\text {th }}$ in the BNC.

Table 29. Rank of high-frequency collocations in the BNC and the TIME corpus

| Nodes | Collocates | Level(N+C) | R. in BNC | F. in BNC | Z-score | R. in TIME | $\begin{gathered} \text { F. in } \\ \text { TIME } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| risk | take | L2 + L1 | 95 | 845 | 49.3 | 28 | 10 |
| job | lose | L1 + L1 | 97 | 839 | 92.1 | 15 | 14 |
| $\mathrm{R}=$ rank, $\mathrm{F}=$ frequency |  |  |  |  |  |  |  |

Table 30. Rank of six high-frequency collocations in the TIME corpus except collocations shown in Table 29

| Nodes | Collocates | Level(N+C) | R. in <br> BNC | F. in BNC | Z-score | R. in <br> TIME | F. in <br> TIME |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| sex | have | L2 + L1 | - | - | 2.5 | 6 | 19 |
| message | send | L1 + L1 | 175 | 548 | 128.1 | 28 | 10 |
| war | fight | L1 + L1 | 275 | 363 | 67.9 | 15 | 14 |
| song | write | L1 + L1 | 352 | 288 | 57.4 | 15 | 14 |
| force | use | L1 + L1 | 352 | 288 | 27.5 | 25 | 11 |
| movie | make | L1 + L1 | 590 | 154 | 15.2 | 28 | 10 |

$\mathrm{R}=$ rank, $\mathrm{F}=$ frequency

The other finding is that high-frequency collocations comprised basic words, as shown in the former sections, 6.2.1. and 6.2.2. The first 100 high-frequency collocations in the BNC consisted of $78.0 \%$ with L1 node and
collocate combinations in Table 24 and $90.7 \%$ of collocations appearing more than six times in the TIME corpus consisted of L1 verbs and nouns in Table 28. Thus, high-frequency collocations in the BNC and the TIME corpus comprised basic words.

### 6.2.4. Are high-frequency collocations topic-oriented?

In order to examine the contexts used in high-frequency collocations in the TIME corpus, the topics in which collocations appeared and their frequency were grouped into four types: Social Sciences, Science \& Technology, Art \& Entertainment and Others (essays \& opinions) as in Table 31. Collocations which occurred 15 times or more, occurred in all topic types. Then as their frequency of occurrence became lower, a few collocations appeared in only one or two topic types. However, among the collocations occurring 10 times or more there were none which were used in only one topic type. High-frequency collocations tend to be used regardless of topics.

As for the collocations occurring 10 times or more, the following observations were made. First, constituents of collocations sharing the same semantic domain were treated in a different way. For example, in the business domain, do job, lose job and do work occurred in all four topic types, while make money did not appear in Art \& Entertainment and raise money did not appear in Science \& Technology and Art \& Entertainment. In the war domain, fight war was used in all four topic types, while use force was not seen in Science \& Technology and Art \& Entertainment, and take risk was not found in Science \& Technology. Second, collocations which were used in daily life did not appear in all the topic types. Take care, open door and answer question occurred in two or three topic types. Especially, open door
was used in two topic types: Science \& Technology and Social Sciences, which were not related to a daily life. Last, make movie and write song seemed to be topic-oriented collocations. However, make movie was used only in Others and Art \& Entertainment, while write song occurred even in Science \& Technology, Social Sciences in addition to Art \& Entertainment.

Table 31. Number of high-frequency collocations in the categorized four topics

| Frequency of <br> collocations | Covered <br> topics | Collocations | No. of <br> S\&T | No. of <br> SS | No. of <br> O | No. of <br> A\&E |
| :---: | :---: | :--- | :---: | :---: | :---: | :---: |
| 45 | 4 | do thing | 9 | 21 | 8 | 7 |

|  | make movie | $\mathbf{0}$ | $\mathbf{0}$ | 3 | 7 |  |
|  | 2 | take risk | $\mathbf{0}$ | 5 | 3 | 2 |

S\&T = Science \& Technology, $\mathrm{SS}=$ Social Sciences, $\mathrm{O}=$ Others (essays \& opinions),
A\&E $=$ Art \& Entertainment

### 6.2.5. Do collocations occurring in English textbooks for upper secondary school in Japan deviate from those of native-speaker English?

Compared with high-frequency collocations in the BNC and in the TIME corpus, collocations in English I textbooks for 10 ${ }^{\text {th }}$ graders in Japan were dealt with in different ways (Appendix C). The main features are described as follows.

1. The number of collocations was very small in each textbook, although each constituent of the collocations appeared respectively.

In order to answer the fourth research question, firstly the frequency of the use of target collocations was checked by means of TXTANA. It was found that $64.2 \%$ of the collocations occurring in the four textbooks consisted of only L1 and $85.7 \%$ of them were of L1 and L2 verbs and nouns in JACET 8000 (see Table 32). This is within the number of words which MEXT recommends in the government guidelines for foreign language teaching: 1300 words should be maximum in English I textbooks. This also meets the recommendation by Tono (2003, p. 29) and Murata (2003, p. 2) that 2000 high-frequency words can cover $81 \%$ of general texts, and so Japanese learners of English should definitely acquire them and collocations are better kept in mind.

Table 32. Frequency of appearance of verb-noun collocations in each level of the English I textbook corpus

|  | N | $\%$ |
| :---: | :---: | :---: |
| L1 | 63 | 64.286 |
| L2 | 21 | 21.429 |
| L3 | 8 | 8.1633 |
| L4 | 1 | 1.0204 |
| L5 | 3 | 3.0612 |
| L6 | 2 | 2.0408 |
| L7 | 0 | 0 |
| L8 | 0 | 0 |

$(\mathrm{L} 1+\mathrm{L} 2=85.714) \quad \mathrm{L}=$ Level

However, a look at the mean number of collocations found in each book shows that very few verb-noun collocations occurred (see Table 33). The standard deviation was also calculated for each book (see Table 33), and it was also found that frequency of the appearance of target collocations was quite low. Thus, the number of collocations is quite small in each textbook.

Table 33. Means and standard deviations per text

|  | Types | M | Std. Dev. |
| :---: | :---: | :---: | :---: |
| Sunshine | 20 | 0.244897959 | 0.538444198 |
| One World | 25 | 0.295918367 | 0.559992336 |
| Unicorn | 29 | 0.387755102 | 0.698048134 |
| Milestone | 32 | 0.571428571 | 0.837275897 |

Table 34. Frequency of appearance of Level 1 verbs and nouns and Level 1 verb-noun collocations

|  | Appearance of Level 1 <br> verbs and nouns | Appearance of <br> Level 1 verb-noun <br> combinations | $\%$ |
| :---: | :---: | :---: | :---: |
| Sunshine | 138 | 10 | 7.246377 |
| One World | 136 | 19 | 13.76812 |
| Unicorn | 171 | 23 | 16.66667 |
| Milestone | 152 | 28 | 20.28986 |
| S+O+U+M in <br> common | 44 | 0 | 0 |

337 Level 1 noun and Level 1 verb collocations are in 1572 targeted collocations.
$\mathrm{S}=$ Sunshine, $\mathrm{O}=$ One World, $\mathrm{U}=$ Unicorn, $\quad \mathrm{M}=$ Milestone

The data are also supported by Table 34 showing the frequency of appearance of L1 verbs and nouns and L1 verb-noun collocations. Thirty hundred thirty seven out of 1572 target collocations consisted of L1 verb and noun combinations. In each textbook 136 to 171 L 1 verbs and L1 nouns in 337 collocations occurred, but the appearance of the combination of the L1 verbs and nouns was $7.2 \%$ in Sunshine, the lowest percentage, and $20.3 \%$ in Milestone, the highest percentage. In other words, although L1 verbs and L1 nouns composing 337 target collocations were used in each textbook, they did
not occur as collocations. Thus, L1 and L2 verbs and nouns which meet the recommendation of MEXT's guidelines were treated in each textbook, but not presented as collocations of verbs and nouns.

## 2. Each textbook had no consensus on what kind of collocation should

## be taught.

Table 35 shows what kind of collocations occurred among the four textbooks. It was found that there were no collocations which appeared in all the four textbooks. Four collocations, make mistake, find way, take step and do thing are common among three textbooks and 10 collocations, take action, push button, make call, take care, make friend, send message, make money, answer question, ask question and give information were common in two textbooks. Another 84 collocations appeared in each textbook. Thus, the use of collocations was different in the four textbooks respectively, indicating that textbooks had no consensus on what kind of collocation should be taught.

Table 35. Appearance of collocations in textbooks

|  | No. | Examples |
| :---: | :---: | :--- |
| collocations appearing in all <br> four textbooks | 0 | make mistake/ find way/ take step/ do <br> thing |
| collocations appearing in three <br> textbooks | 4 | take action/ push button/ make call/ take <br> care/ make friend/send message/ make <br> money/ answer question/ ask question/ <br> give information |
| collocations appearing in two <br> textbooks | 10 |  |
| collocations appearing in one <br> textbook | 84 |  |

## 3. Even collocations appearing in the textbooks were not repeated many times: pedagogical consideration was lacking.

Table 36 shows the frequency of each collocation in each textbook. It was found that the same collocations were not repeated in each textbook. In fact, $74 \%$ of all the collocations that appeared were repeated only once. Three collocations, take photo, make speech and run marathon appeared four times, four collocations, blow whistle, ride bicycle, play game and do thing (in Milestone) appeared three times and 14 collocations, take step, do thing (in Unicorn), give information, ask question, give answer, catch bus, have effect, open eye, eat food, learn language, take pride, make reservation, give speech and have trouble appeared twice.

Table 36. Frequency of each collocation in each textbook

|  | No. | Examples |
| :---: | :---: | :--- |
| four-time appearance of each <br> collocation in each textbook | 3 | take photo, make speech, run marathon |
| three-time appearance of each <br> collocation in each textbook | 4 | blow whistle, ride bicycle, play game, do <br> thing (M) |
| two-time appearance of each | 14 | take step, do thing (U), give information, <br> ask question, give answer, catch bus, have <br> collocation in each textbook |
| effect, open eye, eat food, learn language, <br> take pride, make reservation, give speech, <br> have trouble |  |  |

(one-time appearance of a collocation in each textbook $=64$ )

Findings of the experiments by Crothers \& Suppes (1967), Kachroo (1962), Rott (1999), Salling (1959), Saragi, Nation and Meister (1978) and Zahar, Cobb and Spada (2001) show that words repeated more than five times are acquired by almost all the informants but more than half of words repeated only once or twice are not learned (see section 6.3). It is obvious that these textbooks are not edited to teach collocation effectively.

## 4. High-frequency collocations were common in the BNC, the TIME

## corpus and English I textbook corpus.

Table 37. Rank of high-frequency collocations in the BNC, the TIME corpus and the English I textbook corpus within rank 100

${ }^{1}$ Bold-faced words and numbers show the collocations occurring in the English I textbook corpus, although they do not appear more than 10 times in the TIME corpus.
$\mathrm{N}+\mathrm{C}=$ nouns and collocates, $\mathrm{R}=$ rank, $\mathrm{F}=$ frequency

Table 37 indicates collocations which were ranked within the most frequent 100 in the BNC, and which occurred 10 times or more in the TIME corpus and in the English I textbook corpus (Appendix D).

As mentioned in a previous section, 6.2.3., 25 out of 31 collocations occur as high-frequency collocations within the rank 100 in the both BNC and the TIME corpus, proving high-frequency collocations in both corpora overlap. Table 37 also shows that collocations occurring in the English I textbook corpus were ranked within $100^{\text {th }}$ in the BNC, although some did not overlap with those in the TIME corpus. In fact, 39 out of 98 (40.0\%) collocations occurring in the English I textbook corpus were ranked within $100^{\text {th }}$. The targeted English I textbooks present high-frequency collocations which are in native speaker English corpora, although the number of collocations used was insufficient and they were not repeated.

### 6.2.6. Summary

The above findings were summarized in relation to the postulated research questions.

1. What are high-frequency collocations in large corpora collected from native speakers of English?

Based on the analyses of high-frequency collocations in the BNC and the TIME corpus, many high-frequency collocations overlapped within the rank 100 in both corpora, which can be interpreted as high-frequency collocations by native speakers of English. Among 31 collocations which occur more than 10 times in the TIME corpus, 25 were also ranked within 100 in the BNC. The extremely frequent collocations were in the order of frequency: take place, do thing, have effect, do work, take time, make decision, do job, ask
question, open door, play role, make sense, find way, take step, take care, answer question, tell story, make mistake, play game, have trouble, pay attention, make money, raise money, make choice, take risk and lose job.
2. What are features of those high-frequency collocations by native speakers of English?

2a. Which levels of words are included in the high-frequency verb-noun collocations, in the word list of basic words for Japanese learners of English?

In addition to common collocations in the BNC and the TIME corpus referred to in research question 1, it was found that high-frequency collocations consisted of basic verbs and nouns as a result of the analyses of the BNC and the TIME corpus. This was seen among the 25 extremely high-frequency collocations. Take risk was the only one collocation which consisted of an L2 node and an L1 collocate.

2b. Are high-frequency collocations of native-speaker English related to topics?

The analysis of high-frequency collocations and the topic types where they occurred in the TIME corpus indicated that more than 15 time collocations which appeared occurred in all four topics set for this research. Since the analysis is a small scale, however, more research is needed to confirm this research question.

## 3. How are collocations presented in English textbooks for upper secondary school students in Japan deviated from those of

## native-speaker English?

In fact, the treatment of collocations in the English I textbook corpus was problematic in that few collocations were used in all the English I textbooks and they were not used repeatedly to be fixed firmly in learners' mind. There were 39 collocations which were ranked within the 100 in the BNC.

### 6.3. Discussion

There are three interesting points arising from the corpus data of verb-noun collocations in the BNC, the TIME corpus and English I textbook corpus.

First, high-frequency collocations were high ranked in both the BNC and the TIME corpus. This was contrary to the present writer's expectation because the sources of these two corpora were different: the BNC is extracted samples of British English while the TIME corpus is extracted samples of mainly North American English. The total tokens and types were also different: about 100 million tokens were in the BNC and about 453 thousand tokens were in the TIME corpus. Furthermore, surprisingly, some collocations occurring in the English I textbook corpus overlapped with high-frequency collocations ranked within 100 in the BNC and those which occurred more than 10 times in the TIME corpus, in spite of the very limited total tokens in English I textbooks: about 6000 to 8000 tokens. These were a desirable result in order to identify basic collocations for Japanese learners of English at an early stage.

Second, high-frequency collocations consisted of basic-level words, according to the results of analyzed data extracted from the BNC and the TIME corpus. In fact, collocations composing L1 and L2 verbs and nouns
made up around $85 \%$ of all the occurring collocations in the TIME corpus. In the BNC, the coverage of L1 verb-noun collocations reached $78 \%$, and the coverage of L1 and L2 verb-noun collocations reached 98\% in the first 100 high-frequency collocations. These findings were also desirable for Japanese upper secondary school students because they are expected to develop their four skills comprehensively using textbooks with a very limited number of vocabulary. Thirteen hundred words are targeted for $10^{\text {th }}$ graders, but as they are calculated in the word-form system in which headwords, inflectional forms, reduced forms and derivative forms are respectively counted, these 1300 words will be in fact smaller in number, if they are calculated as one word.

Collocation is a good way to develop a better command of English with a limited number of words. This is supported by many researchers who regard collocation as important in EFL learning. Bahns (1993) and Howarth (1998a, b) emphasize the importance of collocation teaching. So do Ellis (2001), Lexical Approach advocates (Lewis 1993, 2000; Hill 2000), McCarthy (1984), Yorio (1980) and many other researchers (see section 2.4.). Gitsaki and Taylor (1999) claim that teachers should supply new lexical items together with their most frequent collocations in an EFL class while they are being taught. Hattori and Matsuhata (1980), Tono (2003) and Murata (2003) mention that new words would be firmly fixed in students' minds when they are presented with words which have already been learned.

English I textbooks do not present high-frequency collocations repeatedly frequently enough in the same context or in the different context. Previous research proved that words should be repeated six times to be effectively learned on average. Kachroo (1962) examined how many times certain words
were repeatedly presented in a textbook and how they were fixed in learners' memory. His findings showed that words repeated more than seven times were acquired by almost all the informants, and more than half of words repeated only once or twice were not memorized by them. Salling (1959) and Crothers and Suppes (1967) conducted similar experiment. Salling suggests that at least a five-time repetition of words is necessary to be memorized. Crothers and Suppers (1967) claim that words should be repeated six or seven times. According to Rod (1999), six-time repetition of words in a reading textbook results in better acquisition of words than two-time and four-time repetition. Zahar et al. (2001) conducted research on the relationship between the repetition of targeted word and their acquisition by learners of different levels and found that those in lower levels should have more opportunities to be exposed to the target words seven times on average to acquire them. Saragi et al. (1978) came to the conclusion that when students try to keep certain words in their minds through reading a text, they should read it more than 16 times. Shaughnessy, Zimmerman and Underwood (1970) claimed that certain words would be more firmly fixed by repeating them at certain intervals than by doing so intensively. Thus, these pieces of research tell us that collocations should be repeatedly presented much more often in textbooks.

Teachers are required to find ways to expose high frequency collocations to students because collocations cannot be presented repeatedly in the limited number of textbook pages. For example, by reading a text passage including target collocations several times, listening to a tape several times, or presenting examples of sentences including target collocations several times. Explicit learning is an especially effective way to make learners pay
attention to collocations. Schmitt (2000) maintains that both explicit and incidental learning are necessary, especially certain important words, for example, the most frequent words in a language and technical vocabulary, make excellent targets for explicit attention. Nation and Kyongho (1995) argue that we should consider vocabulary teaching in terms of cost/benefits, with the value of learning such words well worth the time required to teach them explicitly; on the other hand, infrequent words in general English are probably best left to incidental learning. Zahar et al. (2001) conducted research on EFL students at lower secondary schools. They acquired 2.16 words on average when they read a 2098 -word text including 30 unknown words. They were expected to learn about 70 words in a year after they read such kinds of text every day. These three pieces of research invite us to teach explicitly collocations which are used frequently.

Third, among collocations extracted from the TIME corpus, some which are related to specific topic types and tend to be ranked lower in the BNC, although they occurred 10 times or more in the TIME corpus. For example, among six collocations which occur 10 times or more in the TIME corpus, but which are not ranked within the 100 in the BNC fight war (275 th $)$ and use force ( $352^{\text {nd }}$ ) are on the Iraqi issues and write song (352 ${ }^{\text {nd }}$ ) and make movie (590 ${ }^{\text {th }}$ ) are on entertainment. TIME American version tends to reflect current domestic issues such as presidential election and the US related issues such as Iraqi war. They may have ranked lower in the more general corpus.

The collocations extracted from the English I textbook corpus also indicated the same tendency. Among more than three-time collocations occurring in the English I textbook corpus, for example, run marathon
occurred four times, highest frequency collocation in the corpus but the rank of this collocation in the BNC is the $838^{\text {th }}$ however. Thus, topic-oriented collocations tend to be ranked low in the general corpus.

Moreover, words of every day use which are frequently used in lower and upper secondary English textbooks also tend to be lower in the general corpus. For example, take photo (566th), blow whistle (689th), and ride bicycle (885 ${ }^{\text {th }}$ ) are frequently used in our daily life, but their ranks are low in the BNC.

Finally, the purpose of English learning of Japanese students must be considered. They need to learn English for General Purposes (EGP) to develop basic English skills, not English for Specific Purposes (ESP) such as technical or business terms. Therefore, basic collocations become requisite for them (see section 2.4). Leech, Rayson and Wilson (2001) support this idea and emphasize the use of frequency data for educational purposes as follows:

#### Abstract

For the teaching of languages, whether as a mother tongue or as a foreign or second language, information about the frequencies of words is important for vocabulary grading and selection. Here frequency has applications to language learning in such areas as: syllabus design, materials writing, grading and simplification of readers, language testing and perhaps even at the 'chalkface' of classroom teaching (Leech et al. 2001: ix).

The editors of JACET 8000 also mention that they struggled with a most challenging task of harmonizing scientific accuracy and educational effectiveness in order to make up a word list for Japanese learners of English. They point out three problems on selection of high-frequency words: (a) They have chosen words related to current affairs such as political issues and economic issues and many vulgar words and slang words; (b) They have
excluded daily words popular in lower and upper secondary English textbooks; and (c) They do not cover words for the beginning level. Therefore, ranks of words based on corpus data were modified, referring to those based on English textbooks for upper secondary students. Based on the viewpoints of Leech et al. and the editors of JACET 8000, collocations should be identified scientifically and educationally for Japanese learners of English in this research.

### 6.4. Basic collocations determined by analyses of corpora

Leech et al. (2001), Nation (2001), Schmitt (2000) and Schmitt \& McCarthy (1997) point out that frequency is the main criterion in analyses of collocations in corpus study. However, the educational point of view as mentioned above needs to be incorporated to consider basic collocations which are requisite for Japanese learners of English at the early stage, especially for secondary school students. Important criteria to select basic collocations by means of the analyses of three corpora are (a) frequency, (b) z-score, (c) level of nodes and collocates, and (d) an educational point of view.

As for frequency, those selected are extremely-high frequency collocations which occur 10 times or more in the TIME corpus and which are also ranked within the top 100 in the BNC and the TIME corpus, and high-frequency collocations which occur more than three times in the TIME corpus and are ranked within the top 100 in the BNC and the TIME corpus.

Z-score is one of the most reliable statistic measures of collocational strength. According to Berry-Rogghe (1973) and Bahnbrook (1996), collocations with numbers over three are statistically significant (see section 5.5.). The present study follows this measurement.

For the third criteria, the level of nodes and collocates, the number of words expected to be learned by secondary school students should be taken into consideration. According to the government guidelines for foreign language teaching issued by MEXT (2003), 1800 words should be chosen for instruction up to the twelfth grade and this number covers L1 and L2 words, meaning the first 2000 basic words. This research targets L1 and L2, but as L1 plays a vital role in basic collocations, L1 words have priority over L2 words.

A pedagogical viewpoint should be taken to think what collocations are basic for Japanese learners of English at the early stage. As JACET 8000 pointed out that general corpora tend to lack daily words which are popular in lower and upper secondary English textbooks, we should include more words used in a daily life for the educational effectiveness. Therefore, collocations which consist of daily words should be chosen although they are ranked lower in the BNC and the TIME corpus. In addition to the collocations occurring more than two times within the top 100 in the BNC, collocations of common nodes and verbs occurring in all the target four English I textbooks are listed as basic collocations in this research.

As mentioned above, these four criteria are summarized as follows:

Table 38. Four criteria to select basic collocation based on the corpus analyses

| (a) frequency | more than 3 time-collocations in the TIME corpus or more than <br> 2-time collocations in the English I textbook corpus within the <br> 100 in the BNC |
| :--- | :--- | :--- |
| (b) z-score | $>3.0$ |
| (c) level of nodes and collocates | L1 or L2 |
| (d) educational point of view | collocations of nodes and collocates of daily use for all the <br> English I textbooks |

Based on these four criteria, the following 61 collocations were selected as
basic collocations as a result of corpus-based analyses.

Table 39. Basic collocations

| 1 | take place | 2 | do thing | 3 | have effect |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | do work | 5 | take time | 6 | make decision |
| 7 | do job | 8 | ask question | 9 | take part |
| 10 | shake head | 11 | open door | 12 | play role |
| 13 | make way | 14 | say thing | 15 | take action |
| 16 | make sense | 17 | find way | 18 | take step |
| 19 | take care | 20 | answer question | 21 | make point |
| 22 | make difference | 23 | take advantage | 24 | tell story |
| 25 | solve problem | 26 | get job | 27 | make mistake |
| 28 | play game | 29 | make effort | 30 | have trouble |
| 31 | hold hand | 32 | pay attention | 33 | close eye |
| 34 | make progress | 35 | make money | 36 | take view |
| 37 | give information | 38 | close door | 39 | give opportunity |
| 40 | write book | 41 | raise question | 42 | pay tax |
| 43 | take look | 44 | hold meeting | 45 | raise money |
| 46 | make choice | 47 | tell truth | 48 | give reason |
| 49 | shake hand | 50 | make claim | 51 | show sign |
| 52 | open eye | 53 | give example | 54 | send letter |
| 55 | take risk | 56 | lose job | 57 | make friend |
| 58 | give answer | 59 | eat food | 60 | give lesson |
| 61 | take lesson |  |  |  |  |

## Chapter 7. Methodology: Phase II. Empirical research on the development of learners' collocational knowledge

### 7.1. Introduction

This second research area examines the mechanism of collocational knowledge of Japanese learners of English, as mentioned in section 4.4.2. As summarized in Chapter 3, many researchers have attempted to clarify how EFL learners acquire collocations and this has been considered key factors to develop their English communication ability for the last two decades. In contrast, research on collocations in Japan has been very limited so that we think it to be significant to conduct empirical research on collocation acquisition by Japanese learners of English, which may lead us to effective ways to develop their collocational knowledge.

In the following sections the methodology is shown in detail. The first section mentions four research questions in order to pursue the purpose. The second section explains selected verb-noun collocations and the sub-categories divided by the features of the collocations. The third section describes subjects who took part in the present research and three kinds of testing materials used in the data collection. The last section presents experiment procedure and scoring procedure.

### 7.2. Research questions

In order to clarify the mechanism of collocation acquisition of Japanese learners of English, the followings are focused on, based on the previous research on collocational acquisition seen in Chapter 3: learners' English vocabulary size, learners' productive and receptive knowledge of English collocation, factors influencing the development of their collocational
knowledge and degrees of collocational knowledge necessary in communication.

The specific research questions are as follows:

1. How are vocabulary knowledge and collocational knowledge related to one another? Will the learners' collocational knowledge expand at the same rate as their vocabulary knowledge in general?
2. What development occurs in learners' receptive and productive knowledge of collocations for different types of collocations at different stages of language learning? Will learners acquire receptive knowledge of collocations first and then productive knowledge of collocations for some types of collocations and various stages of language learning?
3. What influences learners' collocational knowledge? Shortage of general vocabulary knowledge, L1 equivalence, semantic transparency of collocations, collocational restriction, core meanings, collocational structure?
4. How important is collocational knowledge in the acquisition of English communication skills for Japanese learners of English? When collocations cannot be used properly, how will learners express themselves instead of them?

### 7.3. Selected collocations

In this analysis, collocations used were those which were regarded as basic as a result of corpus-based research in Chapters 5 and 6. However, seven of the 61 collocations have two different meanings (make way, play role, take part, take place, take time, take care, take step). For example, take place means (a) something happens, and (b) act instead of someone. Therefore, both two meanings of seven collocations were targeted in this
research, amounting to 68 items.

Table 40. Selected collocations (ID)

| $(1)$ | take place | $(2)$ | do thing | $(3)$ | have effect |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $(4)$ | do work | $(5)$ | take time | $(6)$ | make decision |
| $(7)$ | do job | $(8)$ | ask question | $(9)$ | take part |
| $(10)$ | shake head | $(11)$ | open door | $(12)$ | play role |
| $(13)$ | make way | $(14)$ | say thing | $(15)$ | take action |
| $(16)$ | make sense | $(17)$ | find way | $(18)$ | take step |
| $(19)$ | take care | $(20)$ | answer question | $(21)$ | make point |
| $(22)$ | make difference | $(23)$ | take advantage | $(24)$ | tell story |
| $(25)$ | solve problem | $(26)$ | get job | $(27)$ | make mistake |
| $(28)$ | play game | $(29)$ | make effort | $(30)$ | have trouble |
| $(31)$ | hold hand | $(32)$ | pay attention | $(33)$ | close eye |
| $(34)$ | make progress | $(35)$ | make money | $(36)$ | take view |
| $(37)$ | give information | $(38)$ | close door | $(39)$ | give opportunity |
| $(40)$ | write book | $(41)$ | raise question | $(42)$ | pay tax |
| $(43)$ | take look | $(44)$ | hold meeting | $(45)$ | raise money |
| $(46)$ | make choice | $(47)$ | tell truth | $(48)$ | give reason |
| $(49)$ | shake hand | $(50)$ | make claim | $(51)$ | show sign |
| $(52)$ | open eye | $(53)$ | give example | $(54)$ | send letter |
| $(55)$ | take risk | $(56)$ | lose job | $(57)$ | make friend |
| $(58)$ | give answer | $(59)$ | eat food | $(60)$ | give lesson |
| $(61)$ | take lesson | $(62)$ | take place | $(63)$ | take time |
| $(64)$ | take part | $(65)$ | play role | $(66)$ | make way |
| $(67)$ | take step | $(68)$ | take care |  |  |

In order to investigate influential factors for collocation acquisition, 68 items were examined and characterized in terms of six collocational features, which have been regarded as influential factors by many researchers. The six factors are as follows:

## 1. collocational restriction

2. semantic opacity
3. L1 equivalence
4. delexicalized verbs
5. core meanings
6. collocational structure (prepositions and articles)

Collocational restrictions are one of the main features characterizing collocations, questioning whether constituents can be substitutable with other synonymous words. Each collocation has different degrees along the continuum: some collocations have several substituted synonyms for one or two constituents and others do not. Blum and Levenston (1978) and Gitsaki (1999) confirm that collocational restriction is one of the influential factors for collocation acquisition.

Semantic opacity is the other main feature for collocations, and asks whether the meaning of the combinations is retrievable from each constituent. For example, eat food is transparent because eat and food are clearly understandable, while take a bath is half transparent because bath is clearly understandable, but take is not. Gitsaki (1999) maintains that semantic opacity is one of the influential factors for collocation acquisition.

L1 equivalence refers to whether the given English collocations are equivalent to those of learners' mother tongue or not and it has been regarded as the serious factor exerting influence upon the collocation acquisition for EFL learners. The influence of L1 negative transfer caused by non-L1 equivalence has been supported by many researchers (Bahns \& Eldaw, 1993; Biskup, 1992; Caroli, 1998; Eldaw, 1993; Elyildirm, 1997; Fayez-Hussein, 1990; Gitsaki, 1999; Granger, 1998; Kellerman, 1979; Lennon, 1996; Nesselhauf, 2003).

Delexicalized verbs are components in a large number of multi-word expressions and they have little or no meaning outside the context of particular use. Because of the wide range of patterns into which they enter, it is often more appropriate to think of these words as part of the grammar of English, rather than just as words in the lexicon. Their principle is especially important in Lexical Approach (Lewis, 2002). The main delexicalized verbs are: do, get, give, have, keep, look, make, put, take. Caroli
(1998) examined the learning burden of collocations including lexical words (lexical collocations) and collocations including delexical words (delexical collocations) respectively, but didn't get substantial result. She believed that this result was because learners were familiar with the delexical collocations.

Core meanings are the central and context free meanings. If the constituents of collocations have core meanings, learners are likely to comprehend and acquire them easily. On the contrary, if collocations involve constituents with peripheral meanings or delexical meanings, they are less likely to do so. Kellerman (1979) and Lennon (1996) regard core meanings as important in collocation acquisition.

The final feature, collocational structure (prepositions and articles) is seen when unique prepositions and articles are attached to some verb-noun collocations. For example, in make friends with, friends should be plural and with is necessary to express patient. This feature is not necessarily applicable to all the collocations, but Nesselhauf (2003) regards it as important in that it is necessary to teach not lexical elements but entire combinations including prepositions, articles and etc. to produce entire sentences.

Table 41. Six features and the sub categories of collocations

| six features | sub category 1 | sub category 2 | sub category 3 |
| :--- | :--- | :--- | :--- |
| collocational restriction | substitutable | not substitutable |  |
| semantic opacity | transparent | half-transparent | opaque |
| L1 equivalence | equivalent | not equivalent |  |
| delexicalized verbs | lexical | delexical |  |
| core meanings (verbs) <br> (nouns) | core | peripheral |  |
|  | core | peripheral |  |
| collocational structure <br> (prepositions and articles) | structurally simple | structurally complex |  |

Based on these six features, sub categories (see Table 41) were set up for grouping all the target collocations (see Appendix E).

### 7.4. Materials

### 7.4.1. Test A: Vocabulary size test

Test A is a vocabulary size test (see Appendix F) which was designed by Mochizuki (1998, VST). The purpose of the test is to assess learners' written receptive vocabulary level. The VST was created by improving Aizawa's vocabulary test (cited in Mochizuki, 1998) which was based on Nation's vocabulary levels test1¹(1990, VLT). Aizawa (cited in Mochizuki, 1998) pointed out that the VLT had four main shortcomings when Japanese learners of English took it to measure their vocabulary levels: there are too many loanwords in the test, definitions are too difficult because they are provided in English, levels of used words in the test are improper and vocabulary list consulted for selection of words in the test is inappropriate. He successfully made it appropriate for Japanese learners of English by reducing the proportion of loan words, providing definitions in Japanese instead of those in English, conducting a review of selected words and consulting the Hokkaido University English Vocabulary List (1996, Hokkaido Vocabulary List) for them. Mochizuki (1998) further improved Aizawa's vocabulary test (cited in Mochizuki, 1998) by revising the ways of counting words adopted in the Hokkaido Vocabulary List to make it more reliable for Japanese learners of English. In fact Mochizuki (1998) and Katagiri (2004) confirmed the reliability and validity of the VST. From all mentioned above, the VST is a sufficiently useful and reliable diagnostic

[^8]tool ${ }^{2}$ for Japanese learners of English.
The VST consists of seven levels, 1,000 level test, 2,000 level test, 3,000 level test, 4,000 level test, 5,000 level test, 6,000 level test, and 7,000 level test. The format of the test is word-definition matching. Each test has 15 sections which consist of two Japanese words and six English words as choices, amounting to 30 targeted words. The subjects were asked to match the correct English words to the Japanese words. Thirty words in each level test were selected from each 1000 word-frequency level. For example, in the 1,000 level test, English words equivalent to 30 Japanese words were asked to identify among choices. How vocabulary sizes were estimated in each word-frequency level is shown in Table 42:

Table 42. Way of estimating the number of words in the VST (referred to in Katagiri, 2004)

| Test level | Populations | Samples (VST) | Estimated vocabulary sizes in each word-frequency level |
| :---: | :---: | :---: | :---: |
| Level 7 | 7,000 word-frequency level <br> (1,000 words) | $\Rightarrow 30$ words | (the number of known words out of 30 sampled words) $\div 30 \times 1000$ |
| Level 6 | 6,000 word-frequency level <br> (1,000 words) | $\Rightarrow 30$ words | (the number of known words out of 30 sampled words) $\div 30 \times 1000$ |
| Level 5 | 5,000 word-frequency level <br> (1,000 words) | $\Rightarrow 30$ words | (the number of known words out of 30 sampled words) $\div 30 \times 1000$ |
| Level 4 | 4,000 word-frequency level <br> (1,000 words) | $\Rightarrow 30$ words | (the number of known words out of 30 sampled words) $\div 30 \times 1000$ |
| Level 3 | 3,000 word-frequency level <br> (1,000 words) | $\Rightarrow 30$ words | (the number of known words out of 30 sampled words) $\div 30 \times 1000$ |
| Level 2 | 2,000 word-frequency level <br> (1,000 words) | $\Rightarrow 30$ words | (the number of known words out of 30 sampled words) $\div 30 \times 1000$ |
| Level1 | 1,000 word-frequency level ( 1,000 words) | $\Rightarrow 30$ words | (the number of known words out of 30 sampled words) $\div 30 \times 1000$ |
|  | $\begin{aligned} & \text { Total } 1,000 \text { to } 7,000 \\ & \text { word-frequency level } \\ & (7,000 \text { words }) \end{aligned}$ | 210 | (the number of known words out of 210 sampled words) $\div 210 \times 1000$ |

[^9]
### 7.4.2. Test B: Productive collocation test

Test B is the productive collocation test (see Appendix G), whose purpose is to examine learners' productive knowledge of collocations, targeting 68 collocations selected in the corpus-based research in Chapters 5 and 6.

The productive collocation test is a translation task, which was conducted in a limited number of class hours. In it, 68 English sentences, with blanks for phrases including selected collocations, with a Japanese translation and key word nouns which were constituents of these collocations, were prepared and the subjects were asked to translate them into English phrases. If they did not manage to do the task with the key words, they were then allowed to create other expressions. This is to examine how learners express themselves when they do not know the target collocations.

Attached was a Japanese translation deliberately selected from five English Japanese dictionaries ${ }^{3}$. The Japanese translation might affect learners' translation into English, which has been considered as a main factor by many researchers such as Bahns and Eldaw (1993) and Biskup (1992). In fact those used were the most general Japanese translations for English sentences cited in many of the used English-Japanese dictionaries and they were divided into two categories for the research: ones which include collocations with a Japanese equivalent and ones without a Japanese equivalent.

[^10]
### 7.4.3. Test C: Receptive collocation test

Test C is the receptive collocation test (see Appendix H) with the aim of measuring the learners' receptive knowledge of collocations. The selected collocations were identical to those used in the productive collocation test. The test format was multiple-choice and 68 sentences in the productive collocation test were also used, in which the collocates (verbs) were left out. The choices in each question were three and all of the distracters were synonymous words, which were selected from the Concise Oxford Thesaurus (1997), the Oxford Advanced Learner's Dictionary (2000), Eijiro (2000), an electrical dictionary, the Lighthouse English-Japanese Dictionary (2002), the Super Anchor English-Japanese Dictionary (2003), the Lexis English-Japanese Dictionary (2003). In order to confirm whether the distracters collocate with the nodes, the following collocation dictionaries are referred: the BBI Dictionary of English Word Combinations, Dictionary of English Collocations (1995), COBUILD English Collocations on CD-ROM (1995) and Oxford Collocations Dictionary for students of English (2002). The students were asked to choose one which they thought was right from the three choices.

### 7.5. Subjects

There were 130 Japanese students involved in this test. They were first-year to fifth-year university students, aged 18-23, who were enrolled at several different universities in Japan. They were majoring in engineering, commerce, business administration and human sciences. The first language of all the students is Japanese. Most students had no experience studying abroad.

They have received classroom instruction in EFL for a period of at least six years at lower and upper secondary schools, where it is conducted under
the government guidelines by MEXT. The purpose of English education for them in Japan is to develop their four skills comprehensively and foster a positive attitude toward communication. In order to develop their communication ability, the instruction focuses on oral communication. Textbooks are compiled under the guide of MEXT.

The data collected from the subjects, who completed the VST, productive collocation test and receptive collocation test (130 out of our 200), were analyzed. The data were divided into four groups, based on the scores of the vocabulary test designed by Mochizuki (1998). Table 43 below shows the number of subjects at each vocabulary level.

Table 43. Four groups of subjects

| Categorization | No. of subjects |
| :---: | :---: |
| Group A: 2000 word level | 31 |
| Group B: 3000 word level | 26 |
| Group C: 4000 word level | 41 |
| Group D: 5000 word level | 32 |

### 7.6. Data collection procedure

These three kinds of tests were administered during classroom hours. First, the subjects were asked to take the VST in a classroom hour. As it consists of seven levels, it lasted from 40 minutes to 60 minutes to administer, depending on the subjects' progress of the test. Mochizuki, Aizawa and Tono (2003) indicate that the appropriate level VST to be conducted to measure the subjects' vocabulary levels, should be selected depending on teachers' assessment of their English proficiency. Therefore, judging from the result of another test and daily interaction, appropriate
level tests were used ${ }^{4}$.
The productive collocation test was conducted, following the VST. As this was a translation test, in which the subjects had to comprehend given Japanese sentences with key words and translate them into English, it was supposed to take much more time to complete the tasks. So, two days were given to complete them in order not to disturb regular classroom activities.

The receptive collocation test was conducted, following the productive collocation test. It lasted from 30 to 40 minutes. The period of time for the productive collocation test and the receptive collocation test was not decided in advance. The period of a regular class, the forms of tests and the progress of their taking tests were taken into account so that enough time was given to the subjects.

The students were not allowed to use any dictionaries to check the meanings of words. Moreover, they were not informed about the true purpose of these tests, but were simply told that their vocabulary proficiency would be tested. After finishing all the tests, the answer sheets were returned to students from an instructive viewpoint.

### 7.7. Scoring procedure

The tests results were marked. In the VST and the receptive collocation test, the items were simply scored in terms of correct or incorrect criteria, because both of the tests were multiple choice formats. Therefore, a correct answer got one point and blank or incorrect answer zero points. In the VST, the subject's vocabulary levels were calculated based on the number of

[^11]known words out of 30 sampled words in each level test (see Table 42) and in the receptive collocation test; the total score was 68 points.

On the other hand, the productive collocation test had a complicated scoring procedure, because it was the translation task and got a variety of answers. The subject's answers were classified into the seven categories on the grounds that target collocations had unique features respectively. Table 44 below shows the categorization of their answers:

Table 44. Categorization of correct and incorrect answers

|  | type of correct or incorrect answers |
| :--- | :--- |
| correct <br> answers | correct answers including expected collocations |
|  | acceptable answers including alternative collocations |
|  | acceptable answers described with other expressions |
| incorrect <br> answers | incorrect answers influenced by L1 negative transfer |
|  | incorrect answers including verbalized nouns |
|  | incorrect answers lacking appropriate syntactic structures which could distort meanings. |
|  | incorrect answers |
| blank |  |

Whether the answers given by the subjects were acceptable or not was determined by two procedures. First by consulting the BNC and several other collocation dictionaries (e.g. Oxford Collocations Dictionary for students of English (2002)) and also English-Japanese and English-English dictionaries (e.g. Lighthouse English-Japanese Dictionary (fourth edition, 2002)). Second, remaining unclear answers as to their acceptability were re-evaluated by the respondents were asked to judge their acceptability in terms of three scales: acceptable, intelligible but not acceptable, and not intelligible.

The respondents were 40 advanced English proficiency persons ${ }^{5}$ who were divided into three groups: 17 native speakers of English, nine advanced English proficiency students of EFL and 14 Japanese returnees who were both almost equal to native speakers of English in English proficiency. The results (see Appendices I \& J), however, were too complicated among individuals and among groups to evaluate the acceptability of subjects' answers as acceptable, or not. Therefore, only the sentences which the majority of native-speaker group accepted were treated as acceptable answers in this research ${ }^{6}$. The results including other two groups will be discussed in the last chapter.

5 The background of the respondents is as follows:

| G | Age | Nationality | Native language | G | Age | Nationality | Native language |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M | 21-25 | Britain | English | M | 31-35 | China | Chinese |
| M | 56-60 | USA | English | M | 26-30 | China | Chinese |
| M | 51-55 | France | French/English | M | over 35 | China | Chinese |
| M | 51-55 | Australia | English | M | 26-30 | Mongolia | Mongol |
| M | 51-55 | USA | English | M | 31-35 | Indonesia | Indonesian |
| M | 46-50 | New Zealand | English | M | 26-30 | Thai | Thai |
| F | 21-25 | Britain | English/Cantonese | F | 26-30 | Japan | Japanese/English |
| F | 21-25 | USA | English | M | 15-20 | Japan | Japanese/English |
| M | 15-20 | USA | English | F | 15-20 | Japan | Japanese |
| M | 21-25 | USA | English | F | 15-20 | Japan | Japanese |
| F | 21-25 | USA | English | F | 15-20 | Japan | Japanese |
| M | 15-20 | USA | English | M | 15-20 | Japan | Japanese |
| M | 26-30 | USA | English | M | 15-20 | Japan | Japanese |
| F | 10 | USA | English | M | 15-20 | Japan | Japanese |
| F | over 35 | USA | English | F | 15-20 | Japan | Japanese |
| M | over 35 | USA | English | F | 21-25 | Japan | Japanese/English |
| M | 21-25 | Malaysian | English | M | 21-25 | Japan | Japanese/English |
| F | 26-30 | China | Chinese | M | 21-25 | Japan | Japanese/English |
| F | 26-30 | China | Chinese | F | 15-20 | Japan | Japanese |
| F | 26-30 | China | Chinese | F | 15-20 | Japan | Japanese |

$G=$ Gender

614 Japanese returnees have experienced staying in foreign countries including English-speaking countries over 10 years. Advanced EFL learners (No. 18-26) took higher education in English and their command of English is comparable to that of native speakers of English. However, unfortunately their concrete data (e.g. TOFEL score) were not available. Therefore, data from Nos. 18-40 were not used in the judgment of acceptability of the subjects' sentences, but discussed for the possibility of acceptable collocations in terms of the prospective of English as an International Language in the final chapter.

## Chapter 8. Results and discussion: Phase II. Empirical research on the development of learners' collocational knowledge

### 8.1. Introduction

This chapter describes the statistical results of data gathered from the subjects' answers of three kinds of tests and a discussion about them from various viewpoints. The first section reports statistical results from the general vocabulary measures and the collocation measures (Appendices K \& L) performed on the tests. SPSS, a statistical software tool, was used to analyze the data. The results are shown in the order of the research questions. The second section discusses the findings in light of L2 acquisition theories. The discussion is first conducted following the order of the research questions and then according to the ease or difficulty of the collocations in production and reception in the different vocabulary groups. The final section indicates pedagogical implications according to different stages of development.

### 8.2. Results

### 8.2.1. Research question 1 :

collocational knowledge vs. general vocabulary knowledge

Research question 1 examines whether the learners' collocational knowledge expands at the same pace as their general vocabulary knowledge. First, in order to get an overview of the whole relationship between the general vocabulary size and the receptive and productive knowledge of
collocations, their mean scores and their correlations were calculated by means of descriptive statistics and Pearson correlation. As shown in Table 45 , the mean scores of the vocabulary size, the receptive collocation size and the productive collocation size were $3989.50,40.95$, and 21.72 respectively. In Table 46, the two measurements between the vocabulary size and the receptive and productive collocation size were positively correlated, $r$ $=.778, .828, p=.000$ two tailed.

Table 45. Descriptive statistics: Mean scores for general vocabulary size, productive collocation size and receptive collocation size

|  | $M$ | $S D$ | N |
| :---: | ---: | ---: | ---: |
| Vocabulary size | 3989.50 | 1186.030 | 130 |
| Receptive collocation size | 40.95 | 10.029 | 130 |
| Productive collocation size | 21.72 | 10.856 | 130 |

Table 46. Pearson correlation between vocabulary size and receptive and productive collocation size

|  |  | Vocabulary size | Receptive <br> collocation size | Productive <br> collocation size |
| :---: | :--- | :---: | :---: | :---: |
| Vocabulary size | Pearson <br> Correlation | 1.000 | $.778^{* *}$ | $.828^{* *}$ |
|  | $p$ (two tailed) | . | .000 | .000 |
|  | N | 130 | 130 | 130 |
|  | Pearson <br> Correlation | $.778^{* *}$ | 1.000 | $.794^{* *}$ |
|  | $p$ (two tailed) | .000 | . | .000 |
|  | N | 130 | 130 | 130 |
| Productive <br> collocation size | Pearson <br> Correlation | $.828^{* *}$ | $.794^{* *}$ | 1.000 |
|  | $p$ (two tailed) | .000 | .000 | . |
|  | N | 130 | 130 | 130 |

** Correlation is significant at 0.01 level (two tailed)

Second, the mean scores were calculated for the four different vocabulary groups and compared by means of ANOVA and a post hoc test.

Table 47 shows the mean scores of the receptive collocation size and the productive collocation size for the four different groups individually. In Table 48, the ANOVA indicates a significant difference in the receptive and productive collocation measurements across the four different groups ( $F=$ 49.499, $d f=3, p=.000$ in receptive knowledge of collocations, $F=73.513, d f$ $=3, p=.000$ in productive knowledge of collocations). Furthermore, in order to access pairwise differences among the four levels for the general vocabulary size, a Tukey's test, one of the post hoc tests, was conducted. Table 49 shows that the receptive knowledge of collocations and the productive knowledge of collocations differ significantly among all the four vocabulary levels.

Table 47. Descriptive statistics: Mean scores for receptive collocation size and productive collocation size of the four different vocabulary level groups

|  | Voc level groups | $M$ | $S D$ | N |
| :--- | ---: | ---: | ---: | ---: |
| Receptive collocation size | 2000 | 30.77 | 5.518 | 31 |
|  | 3000 | 32.23 | 8.774 | 26 |
|  | 4000 | 43.15 | 6.814 | 41 |
|  | 5000 | 51.03 | 6.378 | 32 |
|  | total | 40.95 | 10.029 | 130 |
| Productive collocation size | 2000 | 9.42 | 4.365 | 31 |
|  | 3000 | 16.88 | 6.901 | 26 |
|  | 4000 | 25.66 | 6.056 | 41 |
|  |  | 5000 | 32.53 | 8.610 |

|  |  | 3000 | 8.77 (**) | . 000 |
|  |  | 5000 | -6.87 (**) | . 000 |
|  | 5000 | 2000 | 23.11 (**) | . 000 |
|  |  | 3000 | 15.65 (**) | . 000 |
|  |  | 4000 | 6.87 (**) | . 000 |

$\left({ }^{* *}\right)$ The mean difference is significant at the .01 level.

Third, the percentage of correct answers of each collocation in the receptive and productive collocation tests was compared with each other in different vocabulary level groups. In Table 50, there were some collocations in which larger vocabulary level learners could not produce more correct answers than those of lower vocabulary level. The percentage of correct answers of such collocations was extremely high or low and they were generally acquired so easily or difficultly regardless of learners' vocabulary levels. In the receptive collocation test, Table 51 shows that there were more collocations in which less large vocabulary level learners could produce

Table 50. Percentage of correct answers of each collocation in the four different vocabulary level groups - in production (with graph)

| 5000 | 0.78 | 0.91 | 0.97 | 0.50 | 0.78 | 1.00 | 0.81 | 0.84 | 0.78 | 0.66 | 0.78 | 0.88 | 0.97 | 0.38 | 0.53 | 0.66 | 0.78 | 0.56 | 0.91 | 0.59 | 0.59 | 1.00 |

more correct answers than larger vocabulary level learners. Thus, Tables and Graphs show that different collocations were acquired in different ways, although the positive correlation of vocabulary knowledge and the receptive and productive knowledge of collocations were statistically proved in the first two statistical analysis (see section 8.3).

Judging from the statistical results mentioned above, collocational knowledge is developed steadily in both the productive and receptive aspects as the general vocabulary knowledge is wider. Although the contrary to this finding occurs in some collocations, it cannot be denied that the larger the learners' vocabulary is, the more collocational knowledge in both productive and receptive aspects they tend to acquire.

### 8.2.2. Research question 2:

Receptive knowledge of collocations vs. productive knowledge of collocations

Research question 2 seeks to determine how the learners' receptive and productive aspects of collocational knowledge are related to each other for various types of collocations at different stages of language development. First, the correlation between the general vocabulary size and the whole receptive and productive collocation size was examined. According to Table 46 seen in research question 1, the positive correlation between the receptive knowledge of collocations and the productive knowledge of collocations was indicated.

Second, in order to relate these two measures of different vocabulary knowledge, they were compared within the different vocabulary groups by means of the $t$ test. As Table 52 indicates, the result of a two-tailed paired
sample $t$ test confirmed the research question, $(t=23.272,20.636,16.804$, 11.969, $p=.000$ ). In short, the learners' receptive knowledge of collocations is generally broader than their productive knowledge of collocations at any stage of language development.

Table 52. Comparison of receptive knowledge of collocations (R) and productive knowledge of collocations (P) within different vocabulary groups ( $t$ test)

|  |  | $M$ | $S D$ | $t$ (two-tailed) | $d f$ | Sig |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: |
| 2000 voc group | R-P | 21.35 | 5.109 | 23.272 | 30 | .000 |
| 3000 voc group | R-P | 20.35 | 5.027 | 20.636 | 25 | .000 |
| 4000 voc group | R-P | 17.49 | 6.664 | 16.804 | 40 | .000 |
| 5000 voc group | R-P | 18.50 | 8.744 | 11.969 | 31 | .000 |

Third, in order to examine the receptive and productive knowledge of different types of collocations, a comparison of the percentage of correct answers in the receptive and the productive collocation tests was made. Table 53 indicates that the receptive knowledge of collocations was broader than productive knowledge of collocations in each collocation and only four types of collocations shows contrary evidences (see section 8.3).

Judging from the above statistical results, research question 2 proved to be generally true, although the four types of collocations were exceptions. It can be said that receptive knowledge of collocations are deeper than productive knowledge of collocations at all the different vocabulary groups, and that the learners' productive knowledge of collocations becomes broader as they learn more receptive collocations.

Table 53. Percentage of correct answers of each collocation in reception and production (with graph)

|  | 01 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 |

### 8.2.3. Research question 3

## What factors influence learners' collocation acquisition?

Research question 3 surveys influential factors for learners' collocation acquisition. In answering the research question 1, it was confirmed that collocational knowledge and the general vocabulary knowledge were closely related and the more learners' general vocabulary knowledge increased, the more collocational knowledge was acquired. However, some collocations were not acquired according to the development of learners' general vocabulary knowledge. In research question 2 , it was proved that the receptive and productive collocational knowledge was intimately interrelated, and that the more receptive knowledge of collocations was learned, the broader productive knowledge of collocations was. Yet, it was shown that some collocations in the productive collocation test were answered more correctly than those in the receptive collocation test. These two research questions indicated that some collocations could not be explained by learners' shortage of general vocabulary knowledge, in other words, the acquisition was influenced by some other factors. This research question is to investigate what those factors are. In order to do it, correct answers in the receptive collocation test and the productive collocation test were examined in terms of L1 equivalence, semantic opacity of collocations, collocational restriction, delexicalized verbs, core meanings of verbs and nouns, and collocational structure, which were regarded as influential factors for collocation acquisition by some researchers referred to in Chapter 3. The results were summarized in Tables 54 and 55 (for productive test) and Tables 56 and 57 (for receptive test).

First, in order to confirm influential factors for the productive knowledge
of collocations, a Kruskal Wallis analysis of variance ${ }^{1}$ was conducted for the semantic opacity, and Mann-Whitney U analyses for other features. In the semantic opacity, the Kruskal-Wallis analysis of variance (in Table 54) revealed that the group difference was significant, $x^{2}(2)=17.550, p<.01$. To determine the significant differences, Mann-Whitney U analyses were conducted as the post hoc test. After Bonferroni's correction, the results revealed that the differences between transparent collocations and half transparent collocations and between transparent collocations and opaque collocations were significant, $p=.001, .000$, while the difference between half transparent collocations and opaque collocations was not significant. This means that if even one constituent of collocations is not understood, they will be difficult to acquire. Thus, it was confirmed that semantic opacity is an influential factor for productive collocation acquisition, and that collocations whose constituents are half transparent or opaque are more difficult to acquire, while those whose constituents are transparent are more easily acquired.

Mann-Whitney U analyses were conducted to examine whether other features influence the development of learners' productive knowledge of collocations. The analyses revealed a significant difference in L1 equivalence ( $U=157.500, p<.01$ ), delexicalized verbs ( $U=287.500, p<.01$ ), core meanings ( $U=213.000, p<.01$ for core verbs, $U=151.500, p<.05$ for core nouns), and collocational structure ( $U=239.500, p<.01$ ). Only one feature, collocational restriction proved not to be significant. ( $U=569.500, p$

[^12]$=.920)$. Therefore, it follows that collocations will be more easily acquired when they are structurally simple, they have Japanese equivalents, and their constituents consist of lexical verbs, or verbs and nouns with core meanings.

To summarize the results shown above, statistically significant are the group differences in terms of all the factors except collocational restrictions and they would influence the development of productive collocation acquisition for Japanese learners of English.

Table 54. Kruskal Wallis analysis of variance for the sub category difference in the semantic opacity (Productive test)

| Features | Sub categories | N | Mean ranks | $d f$ | $\chi^{2}$ | $\operatorname{Sig}$ |
| :---: | :---: | ---: | ---: | ---: | ---: | ---: |
| Semantic <br> opacity | opaque | 9 | 19.56 |  |  |  |
|  | transparent | 35 | 44.04 | 2 | 17.550 | .000 |
|  | half-transparent | 24 | 26.19 |  |  |  |

The difference is significant between the opaque group and the transparent group and between the half-transparent group and the transparent group at the .00166 level, according to Bonferroni's correction.

Table 55. Mann-Whitney $U$ analyses for the sub category difference in L1 equivalence, collocational restriction, delexicalized verbs, core meanings of verbs and nouns and collocational structure (Productive test)

|  |  | N | Mean ranks | $U$ | Sig. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| L1 equivalence | equivalent | 32 | 47.58 | 157.500 | . 000 |
|  | not equivalent | 36 | 22.88 |  |  |
| Collocational restriction | substitutable | 34 | 34.75 | 569.500 | . 920 |
|  | not substitutable | 34 | 34.25 |  |  |
| Delexicalized verbs | delexical | 41 | 28.01 | 287.500 | . 001 |
|  | lexical | 27 | 44.35 |  |  |
| Core meanings (verbs) | core | 34 | 45.24 | 213.000 | . 000 |
|  | peripheral | 34 | 23.76 |  |  |
| Core meanings (nouns) | core | 58 | 36.89 | 151.500 | . 015 |
|  | peripheral | 10 | 20.65 |  |  |
| Collocational structure | structurally complex | 20 | 22,48 | 239.500 | . 001 |
|  | structurally simple | 48 | 39.51 |  |  |

Next, some factors for the receptive knowledge of collocations were analyzed by means of either a Kruskal Wallis analysis or a Mann-Whitney U analysis. As the format of the receptive collocation test was multiple choice without any Japanese translation aids, L1 equivalence and collocational structure might have little to do with the scores of correct answers. However, all the factors which were examined in productive knowledge of collocations were statistically calculated to make sure that they were related to the development of learners' receptive knowledge of collocations.

As Table 56 indicates, the Kruskal-Wallis analysis of variance revealed that the group difference of semantic opacity was not significant, $x^{2}(2)=$ 5.051, $p=080$. Therefore, it is shown that semantic opacity is not an influential factor for receptive collocation acquisition.

Mann-Whitney U analyses were carried out to examine whether other features influence the development of the learner's receptive knowledge of collocations. As Table 57 indicates there were significant differences in L1 equivalence ( $U=380.500, p<.05$ ), delexicalized verbs ( $U=388.000$, $p<.05$ ), and core verbs ( $U=362.000, p<.01$ ). On the contrary, collocational restriction, core nouns, and collocational structure were not significantly different.

Table 56. Kruskal Wallis analysis of variance for the sub category difference in the semantic opacity (Receptive test)

| Features | Sub categories | N | Mean ranks | $d f$ | $\chi^{2}$ |  |
| :---: | :---: | ---: | ---: | ---: | ---: | ---: |
| Semantic <br> opacity | opaque | 9 | 30.00 |  |  |  |
|  | transparent | 35 | 39.71 | 2 | 5.051 | .080 |
|  | half-transparent | 24 | 28.58 |  |  |  |

Table 57. Mann-Whitney $U$ analyses for the sub category difference in L1 equivalence, collocational restriction, delexicalized verbs, core meanings of verbs and nouns and collocational structure (Receptive test)

|  |  | N | Mean ranks | $U$ | Sig. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| L1 equivalence | equivalent | 32 | 40.61 | 380.500 | . 016 |
|  | not equivalent | 36 | 29.07 |  |  |
| Collocational restriction | substitutable | 34 | 32.90 | 523.500 | . 508 |
|  | not substitutable | 34 | 36.10 |  |  |
| Delexicalized verbs | delexical | 41 | 30.46 | 388.000 | . 038 |
|  | lexical | 27 | 40.63 |  |  |
| Core meanings (verbs) | core | 34 | 40.85 | 362.000 | . 008 |
|  | peripheral | 34 | 28.15 |  |  |
| Core meanings (nouns) | core | 58 | 35.98 | 151.500 | . 139 |
|  | peripheral | 10 | 25.90 |  |  |
| Collocational structure | structurally complex | 20 | 31908 | 428.000 | . 489 |
|  | structurally simple | 48 | 35.58 |  |  |

Judging from all the statistical data shown above to answer research question 3 , all the features except collocational restriction proved to be influential factors for the development of productive knowledge of collocations, while L1 equivalence, delexicalized verbs and core meanings of verbs were influential for the development of receptive knowledge of collocations.

### 8.2.4. Research question 4

## How important is collocational knowledge in the

## acquisition of communication skills?

Research question 4 has a close relation to research question 3 in that it investigates how important collocational knowledge is in the acquisition of English communication skills for Japanese learners of English and what kind of ways learners express themselves with other than collocations. First, ANOVAs and Tukey's tests were conducted to examine descriptive statistics, the differences of alternative collocations and other expressions learners
produced instead of target collocations among the different vocabulary level groups.

Table 58. Descriptive statistics: Mean scores for measurements of alternative collocations and other expressions

| Ways | Voc level | M | $S D$ | N |
| :---: | :---: | :---: | :---: | :---: |
| Alternative collocations | 2000 | 1.06 | 1.263 | 31 |
|  | 3000 | 3.23 | 2.612 | 26 |
|  | 4000 | 4.37 | 1.920 | 41 |
|  | 5000 | 4.09 | 1.924 | 32 |
|  | total | 3.28 | 2.334 | 130 |
| Other expressions | 2000 | . 23 | . 497 | 31 |
|  | 3000 | . 92 | 1.324 | 26 |
|  | 4000 | . 76 | . 830 | 41 |
|  | 5000 | . 44 | . 840 | 32 |
|  | total | . 58 | . 922 | 130 |

Table 59. One-Way ANOVA results for measurements of alternative collocations and other expressions

|  |  | Sum of <br> Squares | $d f$ | Mean <br> square | $F$ | Sig. |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| Alternative <br> collocations | Between groups | 221.752 | 3 | 73.917 | 19.374 | .000 |
|  | Within groups | 480.717 | 126 | 3.815 |  |  |
|  | Total | 702.469 | 129 |  |  |  |
| Other <br> expressions | Between groups | 8.868 | 3 | 2.956 | 3.699 | .014 |
|  | Within groups | 100.701 | 126 | .799 |  |  |
|  | Total | 109.569 | 129 |  |  |  |

In the alternative collocations, mean scores in the four different vocabulary groups (Table 58) were $1.06,3.23,4.37$ and 4.09 individually and they seemed to be statistically significant ( $p=.000$ ), as Table 59 indicated. However, the Tukey's tests (Table 60) revealed that the difference between the 2000 vocabulary group and other vocabulary groups (3000, 4000 and 5000 vocabulary groups) were significant ( $p<.001$ ). Therefore, learners whose vocabulary level was over 3000 used almost the same number of alternative collocations, while learners who had a 2000 vocabulary level
could produce fewer alternative collocations.

Table 60. Tukey's HSD tests for measurements of alternative collocations and other expressions

| Variables | (I)Voc group | (J)Voc group | Mean difference (I-J) | Sig. |
| :---: | :---: | :---: | :---: | :---: |
| Alternative collocations | 2000 | 3000 | -2.17 (**) | . 000 |
|  |  | 4000 | -3.30 (**) | . 000 |
|  |  | 5000 | -3.03 (**) | . 000 |
|  | 3000 | 2000 | 2.17 (**) | . 000 |
|  |  | 4000 | -1.14 | . 099 |
|  |  | 5000 | -. 86 | . 342 |
|  | 4000 | 2000 | 3.30 (**) | . 000 |
|  |  | 3000 | 1.14 | . 099 |
|  |  | 5000 | . 27 | . 935 |

(*) The mean difference is significant at the .05 level
$\left({ }^{* *}\right)$ The mean difference is significant at the .01 level

According to Table 58, the mean scores of other expressions of the four different vocabulary groups were very low ( $M=0.23,0.92,0.76$, and 0.44 individually) regardless of the levels of the learners' general vocabulary knowledge. It seemed that learners did not express themselves with other expressions. The one-way ANOVAs (Table 59) and the Tukey's tests (Table 60) indicated that other expressions learners produced were not significantly different across the four different vocabulary groups except for
one slight difference between the 2000 vocabulary group and the 3000 vocabulary group ( $p<.05$ ). In short, alternatives were not the way learners at any vocabulary level generally use when they did not know the collocations.

It was so far found that learners with more general vocabulary knowledge would successfully express themselves with target collocations and over 3000 vocabulary level learners could use a small number of alternative collocations, but it was very difficult for any learner to paraphrase or describe expressions in alternative ways when they did not know them. When learners did not know how to express themselves, what do they do? Error analysis was carried out in order to find it. Errors were grouped into such type as L1 transfer, blank, structurally errors and verbalized nouns which used only nouns as verbs instead of verb-noun combinations. Table 61 shows the number and percentage of incorrect answers and blanks all the subjects produced.

Table 61. Number and percentage of incorrect answers and blanks

|  | type of correct or incorrect answers | N | $\%$ |  |  |
| :--- | :--- | ---: | ---: | :---: | :---: |
| incorrect <br> answers | incorrect answers influenced by L1 transfer | 197 | 3.3 |  |  |
|  | incorrect answers including verbalized nouns | 573 | 9.6 |  |  |
|  | incorrect answers lacking appropriate collocational structures <br> which could distort meanings | 351 | 5.9 |  |  |
|  | incorrect answers | 1553 | 26.1 |  |  |
| blank |  | 3266 | 55.0 |  |  |
| total |  |  |  |  | 100.0 |

As shown in Tables 62, 63 and 64 below, leaving an answer blank occurred most often to be a popular way to avoid errors when the subjects are not sure how to express themselves. Table 62 shows that mean scores of
blanks at each level were $43.29,30.19,18.66$ and 11.69 , and the lower the learners' vocabulary levels were, the more they tended to resort to blanks. Tables 63 and 64 also confirmed that the numbers of the blanks among the groups were significantly different except between the 4000 vocabulary level group and the 5000 vocabulary level group.

As for L1 transfer, the statistic data shows somewhat complicated results in Tables 62, 63, and 64. In Table 62, the mean scores of L1 transfer slightly rose among the 2000, 3000 and 4000 vocabulary level groups, but they dropped at 5000 vocabulary group. A significant difference was confirmed only between the 2000 vocabulary level group and the 4000 vocabulary level group. In a statistical sense, we cannot say that the higher the learners' vocabulary levels were, the more L1 transfer they made, causing errors.

Verbalized nouns are frequently used regardless of the level of the general vocabulary knowledge in unknown collocations. Table 62 gave an indication of almost the same mean scores among the four groups ( $M=4.48$, 4.73, 4.32 and 4.19). The difference of verbalized nouns among groups was not confirmed in Tables 63 and 64, showing that verbalized nouns were equally used in any different vocabulary level group.

General errors did not prove to have statistically significant differences, either. Mean scores were not much different ( $M=13.32,16.38,17.73$ and 17.50) and the ANOVAs and the Tukey's tests also revealed that the group differences were not significant. Therefore, we cannot say that the less vocabulary the learners had, the more errors they made.

|  |  | 4000 | . 97 | . 098 |

$\left({ }^{* *}\right)$ The mean difference is significant at the .01 level

Structure errors, however, confirmed a significant difference. Mean scores slightly increased ( $M=.90,2.12,3.24$ and 4.22 ) and the ANOVAs and the Tukey's tests also indicated that there was a significant difference between the 2000 vocabulary level group and the 4000 and 5000 vocabulary level groups and between the 3000 vocabulary level group and the 5000 vocabulary level group. This leads to the observation that the higher the learners' vocabulary level was, the more structure errors they tended to make although the differences between adjacent groups were not significant.

Judging from all the statistical data shown in research question 4, learners tended to be error avoiders, that is, they used blanks, avoiding paraphrasing and describing answers with synonymous words when they did not know collocations. In short, only whether they knew proper collocations or not influenced their correct answers.

### 8.2.5. Extra findings

In addition to answering the research questions, examined was whether learners could use appropriate adjectives connected with correct collocations. Sixteen out of the 68 target collocations were connected with adjectives such as make a big decision and do a good job. Producing correct collocations with appropriate adjectives was much more difficult for learners. The difference of the use of appropriate adjectives among the vocabulary groups was examined by means of the descriptive statistics, the ANOVAs and the Tukey's tests.

Table 65. Descriptive statistics: Mean scores for appropriate adjectives with correct collocations

|  | Voc level | $M$ | $S D$ | N |

|  |  | 4000 | . 47 | . 599 |

${ }^{(* *)}$ The mean difference is significant at the .01 level

As Table 65 indicates, the mean scores of use of appropriate adjectives in the four different vocabulary groups were very low ( $M=1.00,1.88,2.88$, and 3.34 individually) regardless of the levels of the general vocabulary knowledge, but they seemed to increase slightly. The one-way ANOVAs (Table 66) and Tukey's tests (Table 67) revealed that the differences significant between the 2000 vocabulary group and the 4000 vocabulary
group and between the 2000 vocabulary group and the 5000 vocabulary group ( $p<.05$ ). Therefore, learners whose vocabulary level was over 4000 could choose more appropriate adjectives with correct collocations than those who belonged to the 2000 vocabulary level group, although the use of appropriate adjectives was quite limited for all the learners.

### 8.3. Discussion

### 8.3.1. Discussion of research questions

This section contains a general discussion on the statistical findings in the previous sections in the order of the research questions.

### 8.3.1.1. Research question 1

Research question 1 confirmed that as learners' collocational knowledge increased as their general vocabulary knowledge increased. This finding contradicts the result of previous research. Bahns (1993) and Carolie (1998) found that learners' performance on collocation were not related to their performance on single lexical words. On the contrary, Gitsaki (1999) and Koya (1999, 2003a) proved that there was significant development of collocational knowledge as general vocabulary knowledge developed.

This contradiction can be explained by the fact that learners' collocational knowledge can be built up easily, depending on how general vocabulary is taught. Caroli (1998) explains that her finding may result from the traditional neglect of presenting new vocabulary with some of its most frequent collocates in EFL vocabulary instruction. She adds the present situation of English education in Italy in which learners are usually led to grasp the basic meaning of words, but not given enough information
about the context. Her theory is supported by many researchers. Howarth (1998a, 1998b) mentions that learners should make a good use of context in order to grasp the basic meaning of words and collocations. He also pointed out that it is important that learners should be aware of the significance of collocations while they learn them. Gitsaki and Taylor (1999) argue that teachers should supply new lexical items together with frequently used collocations in context, which promotes acquisition of more collocations. Lexical Approach proponents such as Lewis (2002) and Hill (2002) have the same point of view (see Chapter 2). Learners' conscious study of collocations in a context and teachers' simultaneous instruction of new vocabulary items and their frequently co-occurring words can promote learners' acquisition of more collocations at the same pace as their expansion of general vocabulary.

Further, Twaddell (1973) and Korosadowixz-Stuzynska (1980) join Howarth (1998a, 1998b) and Gitsaki and Taylor (1999) in arguing that teaching phrase-patterns from early stages in L1 lead learners to expand their vocabulary and adapt it to L2 patterns. In order to do so, they believe that it is important to select "the most habitual parts of language use" (Twaddell, 1973, p. 63) and practice them in a certain context as early as possible in L2.

In short, learners' general vocabulary knowledge and their collocational knowledge are positively related and therefore basic vocabulary should be deliberately acquired with its frequently co-occurring words in context.

The other point concerns some collocations in which greater vocabulary level learners cannot produce more correct answers than lower vocabulary level learners in both productive and receptive collocation tests. In the productive collocation test, such collocations are not or rarely acquired by
all the vocabulary level groups. For example, in open the door, $97 \%$ of learners answered correctly in the 2000 vocabulary level groups, $92 \%$ in the 3000 vocabulary level groups, and $100 \%$ in the 4000 and 5000 vocabulary level groups. On the contrary, in make a point of, $0 \%$ of learners answered correctly in the 2000, 4000 and 5000 vocabulary level groups and $4 \%$ in the 3000 vocabulary level group. Therefore, in such collocations, the difference vocabulary levels are very little.

In the receptive collocation test, the result is different from that of the productive collocation test. Many collocations showed a complicated percentage of correct answers among the different vocabulary level groups. Because the format of the receptive collocation test was multiple choice and it had a limited number of choices, it might be easier to select correct answers. The choices might have been inappropriate. These might have affected the findings.

### 8.3.1.2. Research question 2

Research question 2 confirmed the common sense that receptive knowledge of collocations was generally larger than the productive one and it comes before the productive knowledge at all stages of language learning, as is mentioned by Henriksen (1999), Melka (1997), Nation (2000), Palmberg (1987), Pigott (1981) and Waring (2002). For example, Melka (1997, pp. 85-89) argues that receptive and productive vocabulary knowledge is a continuum and it reflects the notion that one has to perceive a word in reception before he/she produce it. In other words, after learners encounter a new word and gain knowledge of its pronunciation, spelling, word grammar, meaning and the use, they will be able to use it themselves.

He also classifies the continuum into four stages. Imitation and reproduction without assimilation is the first stage of recognition and in it words are repeated without any meaning. The second stage is comprehension, which is a further and more complex stage. As a word is comprehended with meanings in it, it can be perceived through reading and listening. The third stage is reproduction with assimilation, in which a word can be reproduced with meanings only if some key words are provided. Production is the final stage, in which a word can be understood so that they can be used without any trouble in speaking and writing. This continuum model has been widely supported by Henriksen (1999), Waring (2002) and many others to confirm this notion, knowledge scale test was conducted by Joe (1994, 1995), McNeill (1996), Scarcella and Zimmerman (1997).

However, all the words are not necessarily acquired along the continuum. Melka (1997) points out that the boundary between reception and production is fuzzy according to diverse linguistic and pragmatic factors. In other words, some words can be produced quickly after comprehending them and some words may be comprehended and produced at the same time. In some collocations, say thing, write book, raise money, lose job, the percentage of correct answers in the productive collocation test is higher than that in the receptive collocation test. This means that they may not be steadily acquired in accordance with the development of learners' general vocabulary knowledge.

The pedagogical implication of these studies is that learners should receive as much word input as possible. Krashen (1988) maintains that the larger input of words learners perceive, the more productive aspects of them are naturally acquired, which is perhaps true for the acquisition of
collocations as well. The more the receptive knowledge of collocations is developed, the broader the productive knowledge of collocations will be. Therefore, important collocations should be taught repeatedly receptively before productively.

The other implication is that different collocations should be taught in different ways. Krashen's above viewpoint cannot be realized without sufficient input of words. In Japan, however, it is quite limited in English classes in which learners have little chance to receive and produce English collocations. Some collocations are actually produced before perceived completely as the results of research question 2 shows. Therefore, different collocations should be effectively learned by teachers' focusing on their reception or production.

The other finding is that there were four collocations whose test scores in the productive test was higher than those in the receptive test and three of them, say things, write books and lose one's job, were all collocations whose features are transparent, L1 equivalent, structurally simple, having lexical verb and core meanings. In short, they are more easily acquired than other collocations. Therefore, they may be more correctly produced than perceived The fourth collocation is raise money and it is half transparent, not L1 equivalent, structurally simple, lexical verb and peripheral meanings, which are likely to cause more difficult acquisition than the features of the three collocations. However, make money, which was answered by many learners in the productive collocation test, was accepted as alternative collocations of raise money. Therefore, raise money was high-scored in the productive collocation test than in the receptive collocation test.

### 8.3.1.3. Research question 3

In research question 3 it was proved that semantic opacity, delexicalized verbs, core meanings of verbs and nouns, collocational structure and L1 equivalence were influential factors for the development of learners' productive knowledge of collocations, while delexicalized verbs, core meanings and L1 equivalence helped the development of their receptive knowledge of collocations.

Semantic opacity which means to what degrees the constituents of collocations are transparent seems to be a very important factor for learners to develop both receptive and productive knowledge of collocations. It is important to distinguish between idioms and collocations. The more opaque the constituents of a word combination are, the higher degree of idiomaticity of it is and the more likely it is regarded as an idiom. This feature causes difficulty in producing collocations, proved by the findings that collocations whose constituents had opaque or half transparent meanings were difficult to produce.

Another factor, delexicalized verbs, is closely related to semantic opacity. If verbs in verb-noun collocations have little or no meaning outside the context of their particular use, they will be difficult to understand and produce in collocations. Nesselhauf (2003) confirmed that the wrong choice of verb in collocations with a medium degree of restriction resulted in the highest rate of mistakes. Based on the finding she suggests that the focus should be on the verb in the teaching of verb-noun collocations.

Still another factor, core meanings are also intimately related to semantic opacity and deleixcalized verbs. Especially if verbs with many meanings took on little or no meaning, learners tended to face difficulty in
producing verb-noun collocations, as is pointed out by Kellerman (1979) and Lennon (1996). From a pedagogical point of view, Oikawa (1993) recommends that verbs should be focused on to understand and produce correct collocations (see section 3.2.1).

As stated above, semantic opacity, delexicalized verbs and core meanings are concerned with the meanings of the constituents of collocations. The more opaque meaning each constituent has, the more difficult it is likely to produce them.

L1 equivalence is a factor which causes L1 transfer. In other words, the similarity between L1 and L2 collocations lead to L1 positive transfer in the acquisition of L2 collocations, while the difference between them causes negative transfer. This finding has been strongly supported by many researchers (Biskup, 1992; Bahns and Eldaw, 1993; Caroli, 1998; Elyildirm, 1997; Farghal and Obidedat, 1995; Fayes-Hussein, 1990; Gitsaki, 1999; Granger, 1998; Kellerman, 1979; Nesselhauf, 2003). They argue that learners' attention should be directed to collocations which have no direct translational equivalence in L1 to facilitate explicit learning. Furthermore, Lewis (2000) and Woolard (2000) recommend to make use of positive transfer from L1 to facilitate learners' acquisition of collocations, and to use explicit learning is needed to avoid negative transfer from L1 and lessen learners' acquisition burden.

Collocational structure was also confirmed to be an influential factor for learners' acquisition of productive knowledge of collocations in that it is related to grammar. Nesselhauf (2003) suggests that it is important to teach collocations together with prepositions and articles, which have grammatically and semantically close connection to them. Woolard (2000)
proposes that collocations should be recorded with grammar in learners' notebooks because they face difficulty using prepositions in producing sentences with key collocations.

The influential factors which affect the development of learners' productive and receptive knowledge of collocations were, for the most part, within the writer's expectations because they have all been accepted by previous researchers. However, the influence of L1 equivalence on the development of learners' receptive knowledge of collocations was more than had been expected, because Japanese translation is not attached to the test and learners have to select appropriate verbs collocated with nouns from three choices without it. Concerning the relationship between L1 and L2 receptive knowledge of words, Kadota, Nakanishi, Shimamoto, Ikemura, Noro, and Yokokawa (2003, p. 129) define it as translating L2 words into L1 ones and explain that learners make use of their L1 in comprehending L2 words. Jaworski (1998, pp. 354-354) explains that the similarities and differences between languages identified by contrastive analysis should predict the areas of difficulty in L2 learning and errors in L2 reception and production, and in reception interlanguage speakers rely on L1 in interpreting the incoming utterances. Based on these researchers' arguments, the influence of L1 in the selection of correct collocations in the receptive collocation test is fully verified.

### 8.3.1.4. Research question 4 and extra findings

In regard to research question 4, some interesting findings were observed. First, after an overview of the correct answers, it was found that learners in all the vocabulary level groups had difficulty in paraphrasing or
describing answers with synonymous words and other expressions when they did not know the target collocations. Mochizuki et al. (2003) maintain that it is not important to acquire basic collocations because learners can communicate with other expressions without any troubles even if they do not know collocations. However, the present findings indicate that all the different vocabulary group learners had difficulty expressing things with other expressions. Moreover, data analysis confirmed that basic collocations for Japanese learners of English consist of words which are regarded as 1000 level or 2000 level basic words so that they are likely to lessen the learners' burden in acquiring many vocabulary items. This is suitable especially for secondary school students in Japan who are expected to develop their communication ability, but with a very limited vocabulary. Furthermore, many researchers also have strongly suggested the important role of collocations in communication (see Chapters 2 and 3). Hill (2000, p. 53) proposes that up to $70 \%$ of what native speakers of English say, hear, read or write is to be found in collocations. Pawley and Syder (1983, p. 192) state that native speakers of English keep hundreds of thousands of institutionalized sentence stems in their mind. In sum, teaching collocations is most effective for Japanese learners of English.

Among the vocabulary level groups, the 3000 vocabulary level learners used other expressions more frequently than any other groups, instead of either the target collocations and alternative collocations. This was against the present writer's expectation. A possible explanation for this is that 3000 vocabulary level learners had less knowledge of collocations than 4000 and 5000 vocabulary level learners. In fact, 4000 and 5000 vocabulary level learners produced target collocations more correctly than 3000 level
learners. Four thousand vocabulary level learners most produced alternative collocations, although in terms of statistics, learners whose vocabulary level was over 3000 had no significant difference in the production of alternative collocations. Therefore, 3000 vocabulary level learners had less ability producing collocations than 4000 and 5000 vocabulary level learners. As a result, they would have to resort to other expressions to compensate for their lack of collocational knowledge.

Second, L1 transfer gradually increased between 2000 vocabulary level learners and 4000 vocabulary level learners, but the tendency declined at the 5000 vocabulary level. L1 has generally a considerable influence on the way L2 is learned and used (Kellerman, 1979; Naiman, Frohlich, Todesco and Stern, 1978 quoted in Skehan, 1987; Ringbom, 1987). Kellerman explains the transferability hypothesis from L1 in making a L2 collocability prediction, namely, the U-shaped type of transfer behavior. According to Kellerman (1979, pp. 52-55), at an early stage of vocabulary development learners mostly resort to L1 features in selecting possible English collocates. They later contain some developmental target-language features before finally approaching the correct target features. Ringbom (1987, p. 135) states that learners tend to resort to their L1 until they have discovered that it is not the same as L2. Skehan (1989, pp. 76-77) explains that beginning level learners have to apply their L1 patterns to L2 ones because of the lack of perception of the difference between L1 and L2, while advanced learners are likely to have some sense of the limits of translation equivalence, and to realize that it should not be directly used in L2. As these researchers point out, learners have to perceive the distance between L1 and L2 and discover their common ground as well as differences to grasp
the correct L2 features.
This was partially true in the present findings. The decrease of errors influenced by L1 transfer in the 5000 vocabulary level group showed that they had begun to use correct L2 features. However, the 2000 vocabulary level learners made fewer incorrect answers from L1 transfer than the 4000 vocabulary level learners. This can be explained as a result of the blank. It was frequently used by learners in all the vocabulary level groups when they could not produce target collocations or any other acceptable answers. Especially the 2000 vocabulary level learners most often resorted to this, although other vocabulary level learners did so, too. They do not rely on L1, but give up expressing themselves. This tendency is remarked by Blum and Levenson (1978), Ellis (1994) and Biskup (1992). Blum and Levenson (1978, p. 13) and Ellis (1994, p. 693) explain that avoidance often occurs when learners find it difficult to produce L2 structures which are different from those in L1. Biskup (1992, pp. 88-89) concludes from a comparative study of advanced Polish and German students of English that the Polish learners tend to avoid using collocations whose usage they were not convinced of, while German learners try to use alternative ways by paraphrasing and using definitions. He explains that this may result from different teaching policies in Poland and Germany. The Polish teaching of English focuses on accuracy of producing sentences, while the German teaching focuses on the fluency of communication. Based on these two research examples, it can be observed that the reason why learners in any vocabulary level group avoided writing in answers and leave them blank is that they did not know how to describe a sentence in English or they did not want to take risks or make errors because their lack of vocabulary knowledge made them feel
anxious about answering.
Third, verbalized nouns were used by many learners in all the vocabulary level groups, which was beyond the present writer's expectation. These are defined as errors in which nouns are arbitrarily used as verbs. For example, choice was used instead of choose and the following incorrect sentence was produced: You have to choice your job. In the productive collocation test, many key nouns were independently used without the necessary verbs. This feature can be possibly explained by overgeneralization. Overgeneralization is one of the common errors to extend some general grammatical rule to items not covered by this rule in the L2 (Ellis, 1994). In this case, as there are many English words which are used as both verbs and nouns (e.g. work, answer), the common rule might be adapted to items not covered by this rule. Elyildirm (1997) explains these errors might be attributed to incomplete knowledge of solid English proficiency and Fayez-Hussein (1990) considers these errors resulting from a reduction strategy which means an attempt to ignore the need to acquire new rules and using the previously learned ones.

Fourth, as for structural errors and adjective errors, it was seen that 4000 and 5000 vocabulary level learners tended to make such errors. This is not a surprising finding, because structural errors were made by learners who had knowledge of verb-noun collocations, but who remembered them vaguely and had a slight lack of collocability, while adjective errors were made by learners who had acquired correct collocations, but who lacked knowledge of the correct adjectives to be inserted between verbs and nouns. In short, structural errors can be interpreted as collocation errors in interlanguage which is in the process of the acquisition of correct
collocations but adjective errors as collocation errors after the acquisition of correct collocations. Therefore, these types of errors are different from others.

### 8.3.3. Discussion of ease or difficulty of collocation acquisition in reception and production in the different vocabulary groups

In research question 3, it was observed that semantic opacity, L1 equivalence, delexicalized verbs, core meanings of verbs and nouns and collocational structure were influential factors for learners' productive knowledge of collocations, and L1 equivalence, delexicalzed verbs and core meanings of verbs for their receptive knowledge of collocations. Based on these observations, we identify the most difficult collocation groups and the easiest collocation groups to be acquired in reception and production.

## Reception

Table 68. Levels of collocational difficulty in reception
Most difficult collocations to be acquired

1. Collocations affected by three influential factors (ID number) $\mathrm{N}=\mathbf{2 6}$
take place (1) / take time (5) / make decision (6) / take part (9) / make way (13) / take action (15) / make sense (16) / take step (18) / take care (19) / make point (21) / take advantage (23) / make mistake (27) / make effort (29) / make progress (34) / make money (35) / take view (36) / take look (43) / make choice (46) / make claim (50) / take risk (55) / make friend (57) / take place (62) / take part (64) / make way (66) / take step (67) / take care (68)
2. Collocations affected by two influential factors (ID number) $\mathrm{N}=11$
have effect (3) / find way (17) / make difference (22) / have trouble (30) / raise question (41) / raise money (45) / send letter (54) / give lesson (60) / take lesson (61) / take time (63) / play role (65)
3. Collocations affected by one influential factor (ID number) $\mathbf{N}=10$
do thing (2) / do work (4) / do job (7) / play role (12) / get job (26) / give information (37) / give opportunity (39) / hold meeting (44) / give reason (48) / give answer (58)
4. Collocations affected by no influential factors (ID number) $\mathbf{N}=21$
ask question (8) / shake head (10) / open door (11) / say thing (14) / answer question (20) / tell story (24) / solve problem (25) / play game (28) / hold hand (31) / pay attention (32) / close eye (33) / close door (38) / write book (40) / pay tax (42) / tell truth (47) / shake hand (49) / show sign (51) / open eye (52) / send letter (54) / lose job (56) / eat food (59)

Least difficult collocations to be acquired

## Production

Table 69. Levels of collocational difficulty in production
Most difficult collocations to be acquired

1. Collocations affected by six influential factors (ID number) $\mathrm{N}=3$
take part (9) / take step (18) / make point (21)
2. Collocations affected by five influential factors (ID number) $\mathrm{N}=14$
take place (1) / make way (13) / make sense (16) / take care (19) / take advantage (23) / take view (36) / take look (43) / make claim (50) / make friend (57) / take place (62) / take part (64) / make way (66) / take step (67) / take care (68)
3. Collocations affected by four influential factors (ID number) $\mathbf{N}=11$
take time (5) / make decision (6) / take action (15) / find way (17) / make mistake (27) / make effort (29) / make progress (34) / make money (35) / raise question (41) / make choice (46) / take risk (55)
4. Collocations affected by three influential factors (ID number) $\mathrm{N}=7$
have effect (3) / make difference (22) / have trouble (30) / raise money (45) / take lesson (61) / take time (63) / play role (65)
5. Collocations affected by two influential factors (ID number) $\mathrm{N}=5$
do thing (2) / play role (12) / hold meeting (44) / give example (53) / give lesson (60)
6. Collocations affected by one influential factor (ID number) $\mathrm{N}=10$
do work (4) / do job (7) / get job (26) / pay attention (32) / give information (37) / give opportunity (39) / give reason (48) / shake hand (49) / show sign (51) / give answer (58)
7. Easiest collocations affected by no influential factors (ID number) $\mathrm{N}=18$
ask question (8) / shake head (10) / open door (11) / say thing (14) / answer question (20) / tell story (24) / solve problem (25) / play game (28) / hold hand (31) / close eye (33) / close door (38) / write book (40) / pay tax (42) / tell truth (47) / open eye (52) / send letter (54) / lose job (56) / eat food (59)

## Least difficult collocations to be acquired

The order from high to low frequency of correct answers in the productive and receptive collocations test was examined to confirm whether influential factors would affect the development of learners' collocational knowledge in production and reception, compared with levels of collocational difficulty shown in Tables 68 and 69.

## All groups

Before looking at the high and low frequency of correct answers in production and reception in the different vocabulary level groups, the data
in all the vocabulary level groups was examined to summarize the general tendency of the high and low frequency of the correct answers. Tables 70 and 71 indicate that collocations which had a high frequency of correct answers in production and reception tended not to be affected by the above mentioned influential factors while those which had a low frequency were affected by many influential factors. However, there were some exceptions. In production among the high frequency of correct answers as is in Table 70, only one collocation make money was affected by four influential factors. Among the low frequency of correct answers, have effect, ranked $10^{\text {th }}$, was affected by three influential factors. Show sign, ranked $10^{\text {th }}$, was affected by one influential factor. In reception among the high frequency of correct answers as is seen in Table 71, take care, ranked 8 ${ }^{\text {th }}$, take risk, ranked $10^{\text {th }}$, were both affected by three influential factors, while among the low frequency of correct answers, do job, ranked $2^{\text {nd }}$, and give lesson, ranked $8^{\text {th }}$, were both affected by one influential factor.

One possible explanation for these exceptions is the subjects' familiarity with the collocation constituents or the collocations themselves. Take care and make money are often used in English textbooks for secondary school students, as Table 35 in Chapter 6 indicated. In contrast, raise, effect, and sign might be unfamiliar to most of them, and do job may be also unfamiliar even if they know the following fixed phase, good job!. The other explanation for the exception might be inadequate choices in the receptive collocation test.

Table 70. Order of high frequency and low frequency correct answers in the productive collocation test all groups ( $\mathrm{N}=130$ )

$\mathrm{F}=$ Number of factors affecting difficulty of collocations

## The 2000 vocabulary level group

In the 2000 vocabulary level group, two outstanding tendencies were found in Tables 72 and 73 . One was that among high frequency correct answers, collocations which were affected by one or zero influential factors, were answered correctly in production. Only two exceptions take care and take risk in reception could be related to the students' familiarity with the collocations as seen in the results of all the groups.

Table 72. Order of high frequency and low frequency correct answers in the productive collocation test 2000 level ( $\mathrm{N}=31$ )

| high frequency correct answers |  |  |  |  | low frequency correct answers |  |  |  |  |

|  |  |  |  |  | 1 | 67 | take step | 5 | 0 |

$\mathrm{F}=$ Number of factors affecting difficulty of collocations

The other was that among the low frequency correct answers, various collocations affected by both many and few influential factors were listed in both production and reception. This is because even easier collocations to acquire were difficult to produce properly for the 2000 vocabulary level learners owing to their lack of vocabulary knowledge, as Nesselhauf (2003) mentions.

Table 73. Order of high frequency and low frequency correct answers in the receptive collocation test -
2000 level ( $\mathrm{N}=31$ )

| high frequency correct answers |  |  |  |  | low frequency correct answers |  |  |  |  |

|  |  |  |  |  | 10 | 63 | take time | 2 | 7 |

F = Number of factors affecting difficulty of collocations

## The 3000 vocabulary level group

In the 3000 vocabulary level group, almost the same tendencies as the 2000 vocabulary level group could be seen in Tables 74 and 75. In the high frequency of correct answers, almost all the collocations listed were affected by few influential factors. The only one exception was make money which was affected by four influential factors but it is often used in English secondary school textbooks, as seen in Table 35 in Chapter 6. Among the low frequency of correct answers, even collocations affected by one or zero influential factors were listed in both reception and production, however the number was less than that in the 2000 vocabulary level group. This is attributed to the lack of learners' vocabulary knowledge or possibly the distracters in the receptive collocation test puzzled them.

Table 74. Order of high frequency and low frequency correct answers in the productive collocation test 3000 level ( $\mathrm{N}=26$ )

| high frequency correct answers |  |  |  |  | low frequency correct answers |  |  |  |  |

## The 4000 vocabulary level group

In the 4000 vocabulary level group, two tendencies different from the 2000 and 3000 vocabulary level groups were seen in Tables 76 and 77. One was that among the high frequency correct answers for reception, collocations which were affected by more influential factors were listed: take risk, take part ( $\mathrm{ID}=9$ ), take care ( $\mathrm{ID}=19$ ), take care ( $\mathrm{ID}=68$ ). The other was that among the low frequency correct answers for both reception and production, easier collocations to be acquired were less listed: show sign in
production and do job and shake head in reception. Judging from these tendencies, the more influential factors collocations were affected by, the more difficult they would be acquired.

$\mathrm{F}=$ Number of factors affecting difficulty of collocations

## The 5000 vocabulary level group

In the 5000 vocabulary level group, the same two tendencies mentioned in the 4000 vocabulary level group were seen in Tables 78 and 79. One more
tendency could be found in this group: in production, collocations which were in the medium degree of difficulty clearly appeared as not only high frequency correct answers (e.g. make money) but also as low frequency correct answers (e.g. raise question, have effect and find way). This shows the process of the acquisition of collocations. In other words, among high frequency correct answers, easier collocations which were affected by fewer influential factors were more common and among low frequency correct answers, more difficult collocations affected by more influential factors were ranked common. Collocations with a medium degree of difficulty were seen in both categories. However, in the 5000 vocabulary level group not only easier collocations, but also collocations with a medium degree of difficulty were ranked among high frequency correct answers. And not only more difficult collocations but also collocations with a medium degree of difficulty were ranked among the low frequency correct answers. This means that learners in this group acquire wider range of collocations than in other groups.

F = Number of factors affecting difficulty of collocations

After examining all the groups independently, among the collocations which were not answered correctly, not only were more difficult collocations found but also easier collocations could be seen in the 2000 and 3000 vocabulary level groups, but in the 4000 and 5000 vocabulary level groups only more difficult collocations appeared. Among the collocations which were answered correctly, only collocations which were little affected by influential factors could be seen in the 2000 and 3000 vocabulary level groups. However, in the 4000 and 5000 vocabulary level groups, collocations which were affected by more influential factors could be seen and in 5000 vocabulary level groups, collocations with a medium degree of difficulty also appeared. These tendencies in the 4000 and 5000 vocabulary level groups are related to varying degrees of learners' vocabulary knowledge. Also it was revealed that there was another factor, familiarity with the constituents of the collocations or the collocations themselves, but this remained to be established.

### 8.3.4. Summary of the collocation acquisition in the different vocabulary level groups

The results and discussion in the previous sections are herein summarized as follows:

1. There was a close correlation between learners' general vocabulary knowledge and their collocational knowledge. In other words, the more vocabulary knowledge learners had, the more collocational knowledge they tended to acquire.
2. Receptive knowledge of collocations appeared to be deeper than productive knowledge of collocations. Therefore, learners' productive knowledge of collocations would be broadened as they learned more receptive collocations.
3. Factors which influence the development of productive collocational knowledge were the vocabulary knowledge, semantic opacity, delexicalized verbs, core meanings of nouns and verbs, collocational structure and L1 equivalence. The vocabulary knowledge, L1 equivalence, delexicalized verbs and core meanings of verbs affected the development of their receptive knowledge of collocations. The following figure schematically summarizes the factors influencing the development of collocational knowledge.

Figure 6. Factors influencing the development of collocational knowledge ${ }^{2}$
4. Neither easier nor more difficult collocations the 2000 vocabulary level learners could correctly answer. As learners' vocabulary was broader, they could answer easier collocations more correctly and more difficult collocations remained to be acquired.
5. When learners could not produce the target collocations, they would have little chance to succeed in communication because alternative collocations were rarely used by even over the 3000 vocabulary level learners and

[^13]paraphrasing or describing expressions in alternative ways was also difficult for almost all learners.
6. Learners between the 2000 vocabulary level groups and 4000 vocabulary level groups gave incorrect answers with the common techniques, leaving an answer blank, when they did not know the appropriate expressions. Learners whose general vocabulary knowledge was lower tended to resort to it. The second most often used way was by verbalizing nouns, which learners in all the groups resorted to. The structural errors were the third most frequently used technique but more errors of this kind were made by learners whose vocabulary level was higher.
7. The 5000 vocabulary level learners used different techniques from other vocabulary level learners. Leaving an answer blank was the second most often used technique, followed by general errors. This means they attempted to produce some words to express themselves, although they were not regarded as correct answers. Their structural errors were closer to correct collocations than other level groups' but adjective errors still occurred after correct collocations were acquired.

### 8.3.5. Pedagogical implications

Findings in the present research indicate some effective pedagogical implications as follows:

## 1. Solidify learners' basic vocabulary

It was found in this data analysis that the lack of basic vocabulary badly
affected learners' development of collocational knowledge. Basic vocabulary is fundamental to the basic English skills of speaking, listening, reading and writing, and it is also significant in the acquisition of basic collocations, because they mainly consist of 1000 or 2000 level words, as the data analysis I showed. Basic vocabulary will also lead to fluent communicative ability (Pawley and Syder, 1983, p. 192). The positive correlation between the general vocabulary knowledge and collocational knowledge was also indicated by this research. Therefore, the learners' fixed basic vocabulary has to be broadened especially for 2000 and 3000 level learners who obviously lack collocational knowledge.

## 2. Present new vocabulary with some of its most frequent

 collocations.When teaching basic vocabulary, a teacher should couple it with words that frequently co-occur and help learners build a database of collocations. For example, decision should be introduced with make.

In this case, two points should be taken into consideration. One is that learners should be aware of collocations at all stages of English acquisition, as many researchers have pointed out (see section 8.3.1.1.) The other is that collocations should be presented in context. Thus, learners' conscious leaning of collocations in context and teachers' simultaneous instruction of new vocabulary and frequently co-occurring words will accelerate the acquisition of more collocations along with the expansion of general vocabulary. This instruction is needed for all the vocabulary level learners, especially 2000 and 3000 level learners who obviously lack their collocational knowledge.
3. Present collocations in different ways according to their different features

Basically, collocations should be explicitly taught by directing learners' attention to them. And as broader productive knowledge of collocations generally follow the development of learners' receptive knowledge of collocations, receptive knowledge of collocations has to be first focused on through reading or listening activities. However, it is possible that different collocations have different processes of acquisition. Some may follow the regular process from reception to production, but some may be acquired receptively and productively at the same time. Moreover, some collocations can be perceived, but they cannot be produced (e.g. take risk), so that the productive aspect should be explicitly focused on. Therefore, different collocations should be taught differently in accordance with their different processes of acquisition. In order to do this, teachers have to be familiar with the features of basic collocations and the process of the development of learners' collocational knowledge. This should be considered in instruction for all vocabulary level learners.

## 4. Teach collocations by focusing on the shortcomings of different level vocabulary learners

Different vocabulary level learners have different shortcomings in the acquisition of collocations as follows:

## The 2000 vocabulary level learners

As the 2000 vocabulary level learners have an obvious lack of collocational knowledge, teachers should explicitly present basic
collocations to have them recognize and remember them. Positive transfer from L1 should effectively be used to facilitate the acquisition of collocations, avoiding negative transfer from L1. This will lessen the acquisition burden. Necessary information about collocations such as L1 transfer should be written in students' notebooks to build up their own database and keep them in their memory, as researchers of Lexical approach maintain.

## The 3000 vocabulary level learners

As the 3000 vocabulary level learners still have a relatively small collocational knowledge, it should be strengthened and solidified more by several repetitions of basic collocations. In order to keep learned collocations in their long term memory, they should be reviewed at least three times within a month, according to Iketani (2002). These students are still poor at perceiving and producing difficult collocations which are affected by many negative factors and those affected by one or zero negative factors. Therefore, explicit learning of collocations is needed.

## The 4000 vocabulary level learners

The 4000 level learners have more collocational knowledge than 2000 and 3000 level learners, but they are still influenced by L1 transfer. It is important to have learners discover more commonality and differences between L1 and L2 to grasp the correct L2 features by acquiring a broader basic vocabulary.

## The 5000 vocabulary level learners

The 5000 level learners have much collocational knowledge, but they still have to focus on collocation learning in order to use them properly, especially collocations including articles and prepositions. The lack of necessary articles and prepositions will distort the meaning of the
sentences.
As stated above, instruction should be focused on learners' different collocational development.

## 5. Verbs should be explicitly focused on when teaching collocations

It was found in this research that the meanings of verbs affected learners' receptive and productive knowledge of collocations. Especially, collocations whose constituents were delexical verbs with opaque and peripheral meanings should be explicitly taught to raise learners' awareness of them and keep them firmly in their minds. Oikawa (1993) maintains that this instruction should start from the learners' beginning stage of collocational acquisition.

## Chapter 9. Conclusion

### 9.1. Overview

This research intended to identify basic collocations for Japanese learners of English, investigate their collocation acquisition process, and propose their effective instruction. It is important to conduct this investigation because there has been little empirical research on collocations in Japan. The definition and features of collocations have not been sufficiently identified, no consensus on basic collocations for Japanese learners of English has been reached, and no evidence which supports the mechanism of development of their collocational knowledge has been established. In order to explicate these problems and help learners develop a better command of English with collocations, both theoretical and practical studies needed to be conducted.

Chapter 2 reviewed the literature on collocation studies in terms of the distinction of collocations, idioms and free combinations, as well as in terms of five study domains and the importance of collocations. First, it was found that many researchers had reached a consensus that semantic opacity and collocational restriction were the two criteria to distinguish phraseological combinations. However, as these criteria were a matter of degree along a continuum, it had been difficult to clearly divide the above three phraseological combinations.

Second, previous literature on collocations was examined from five domains: descriptive studies, semantic studies, computational studies, lexicographic studies, and pedagogical studies. Researchers presented their own perspectives on collocations in the different domains and on criteria to
define collocation clearly. They were mainly divided into two groups: objective criteria and subjective criteria. Objective criteria were related to statistics such as $z$-score and t-score, frequency of co-occurrence, collocational range and adjacency (span), while subjective criteria were concerned with features of collocations such as collocational restriction and semantic opacity which could not be calculated because they were degrees along a continuum. Both criteria have been regarded as important to explain collocations by many researchers, but we consider that objective criteria are landmark for EFL teachers and learners who have had to depend on native speakers' intuition to judge acceptability of collocations. It is because they can easily obtain new objective facts about English collocations, i.e. how collocations are actually used via computers without relying on native speakers' intuition.

Third, it was found that many researchers had pointed out importance of collocations in terms of memorization, fluent and appropriate language use, aspects of knowing words, word models and teaching effectiveness.

In Chapter 3, previous empirical research on the acquisition of collocations was summarized. This research had been conducted mainly from two perspectives: from L2 influence and from various influential factors such as lack of vocabulary knowledge and overgeneralization including L2 influence. Although this research had intensively been carried out for the last two decades the world over, research on collocations in Japan was extremely limited. Only recently, however, the importance of collocations was recognized and collocation research began to be spotlighted mainly in the lexicographic domain and corpus studies. Yet empirical research on the collocation acquisition by Japanese learners of English has not started.

In order to conduct research on collocation acquisition by Japanese learners of English, two purposes were set up in this thesis: the identification of basic collocations for Japanese learners of English and the investigation of the development of their collocational knowledge. Before the research was conducted, some pilot studies were carried out (in Chapter 4).

In Chapters 5 and 6, in order to identify basic collocations for Japanese learners of English, high frequency collocations used by native speakers of English were examined, and compared with high frequency collocations in English textbooks for secondary school students in Japan. Only verb-noun collocations were targeted in this research because they played the most important role in communication. The nouns were all based on JACET 8000, intended for Japanese learners of English to identify the basic collocations. Actually, one's collocational competence is best reflected in its native speaker's ability in establishing or confirming rules of the grammar and the usage of language (Crystal, 1992). Their use of collocations should never be ignored in identifying basic collocations for Japanese learners of English because we have no alternative ways other than relying on it at present. However, native speaker's intuitive collocations are not necessarily equal to what is expected as the basic collocations for Japanese learners of English and they have to be examined in terms of the importance of collocations for Japanese learners of English. Therefore, nouns which were the node in verb-noun collocations were all selected from JACET 8000 which presented words needed for Japanese learners of English.

In this research, BNC, TIME and English I textbook corpora were used. The findings showed that high-frequency collocations in the BNC and the TIME corpora were fairly common and they partially overlapped with those
in the English I textbook corpus. They consisted of basic verbs and nouns in reference to JACET 8000 and they tended to be used regardless of the topics. Basic collocations in this research were determined to consist of the common high-frequency collocations found among the three corpora and they were regarded as necessary for Japanese learners of English from a pedagogical point of view. The sixty-one collocations were finally selected as basic collocations as a result of this corpus-based research.

In Chapters 7 and 8, empirical research on learners' development of the basic collocations was conducted. The research especially focused on the relationship between their general vocabulary knowledge and their collocational knowledge, and between their productive knowledge of collocations and their receptive knowledge of collocations, as well as influential factors affecting the development of collocational knowledge and the importance of collocational knowledge in communication. Three kinds of tests, a vocabulary size test, a productive collocation test, and a receptive collocation test were administered with the basic collocations identified in Chapters 5 and 6 on 130 university students.

The findings were: (a) there was a high positive correlation between learners' general vocabulary knowledge and their collocational knowledge and between their receptive knowledge of collocations and their productive one; (b) factors which influenced the receptive knowledge of collocations were the vocabulary knowledge, L1 equivalence, delexicalized verbs and core meanings of verbs, while semantic opacity, core meanings of nouns and syntactic collocational structure in addition to these same factors for reception were influential factors in students' productive knowledge of collocations; and (c) learners could not succeed in communication without
collocations and when they were not sure of them, their mistakes such as leaving an answer blank, verbalized nouns, and L1 transfer were commonly found.

To summarize all these chapters, the points of the present writer's research are as follows: (a) a clearer definition of collocations based on a previous literature review was established, (b) basic verb-noun collocations for Japanese learners of English were identified, and (c) how to develop students' knowledge of verb-noun collocations was clarified. All of them will contribute to the effective instruction in collocations in the classroom in Japan and to the effective compilation of English textbooks and collocation exercise books. The research will also provide a clearer definition of collocations for Japanese teachers of English and Japanese learners of English and concrete answers for ambiguous descriptions of "basic collocations" in the government guidelines for foreign language teaching compiled by MEXT.

### 9.2. Pedagogical implications for effective compilation of English textbooks

On the basis of the findings and the discussion of corpus-based research (Chapters 5 and 6) and empirical research (Chapters 7 and 8), we should suggest to textbook writers the compilation of new English textbooks in the light of effective collocation acquisition.

First, textbook writers have to present basic collocations in the English textbooks because collocations should be acquired to develop learners' better command of English as is mentioned in previous chapters. In order to facilitate learners' collocation acquisition they should take account of the
appropriate order of presentation of basic collocations: (a) in the order of the importance of words to be acquired and (b) in the order of the difficulty of collocations to be acquired. Basic collocations consist of basic-level words such as the first 1000 and 2000 basic words in accordance with JACET 8000 (2003) as is found in corpus-based research (Chapters 5 and 6). As MEXT designs lower secondary school students to learn 900 basic words, many of them should be included in the lower secondary school English textbooks. For example, do, get, and lose should be presented with job as collocations in English textbooks because they are listed as basic words in the government guidelines for foreign language teaching. As for (b), basic collocations are different in the level of collocational difficulty affected by influential factors, as is shown in Tables 68 and 69. For example, lose job is more difficult to acquire than $d o j o b$ and get job in reception and production and therefore, lose job is introduced after the other two job collocations. Thus, textbook writers should arrange basic collocations in the lower and upper secondary school textbooks from these (a) and (b) perspectives.

Second, English textbooks for lower and upper secondary school students should be compiled on the basis of the same basic collocations so that students can learn them with any textbook which English teachers select at different schools. Corpus-based research in Chapter 6 showed English I textbooks have no consensus on what kind of collocation and how many should be taught. In short, students who use different textbooks learn different collocations. Textbook writers should have consensus on basic collocations in compiling English textbooks. In order to do it, MEXT should concretely specify basic collocations to be learned in each grade in the government guidelines for foreign language teaching.

Finally, textbooks writers have to show basic collocations repeatedly in context. As previous research proved that words should be repeated six times to be effectively learned, this would be true of effective collocation acquisition (see section 6.3). Moreover, previous research also confirmed that collocations should be learned in context (see section 8.3.1.1). Therefore, basic collocations should appear six times in context in English textbooks. However, it may force many basic collocations to appear in an unnatural context because of the limited pages of English textbooks. In that case, textbook writers should make up collocation exercise books, which repeatedly raise learners' attention on collocations in different ways such as a collocation box, producing example sentences and collocation dominoes.

### 9.3. Limitations of the study

Three main limitations need to be mentioned with regard to corpus-based and empirical research.

The first one is related to the use of corpora in corpus-based research. The TIME corpus was collected from 17 issues over four months. But, they do not seem sufficient and more samples from TIME magazines should have been utilized. Full American National Corpus, consisting of 100 million words, is expected to be in place in the fall of 2005 . It should be used and compared with the BNC in terms of collocations in the future research.

The second one is concerned with choices in the receptive collocation test. In fact, several dictionaries were referred to make the choices. However, the results of the test were so complicated that not all of these could be sufficiently explained. That is because some distracters were intentionally selected to confuse the subjects. The choices should have been selected more
carefully.
The third one is involved with influential factors in empirical research. It was found that some influential factors affected learner development of collocational knowledge for both reception and production. However, it could not be determined which factor was the most or least influential factor. Moreover, familiarity with the collocations might be an influential factor, which was not established by this research.

The final limitation is concerned with the notion of English as an International Language (EIL, see the following section). The present writer attempted to adapt the notion of EIL to this research and conducted an investigation. The attempt was to judge whether unclear answers produced by subjects were acceptable or not, questionnaires (see Appendix L) were distributed to native speakers of English, advanced English proficiency EFL students and Japanese returnees who were almost equal to native speakers of English in English proficiency (see footnote 5 in Chapter 7). In the questionnaires seventy sentences containing different verbs of some collocations, and articles and prepositions closely related to these collocations were asked to evaluate. The results were so varied in the three groups that they could not be examined and categorized properly. Therefore, for this research only the judgment by the native speakers of English was used, because scores displaying EFL learner and Japanese returnee English proficiency was not available and so they could not be treated under the concept of EIL.

Table 80. Judgment of 70 acceptable collocations by the three groups (Phase II. Empirical research)

| Judgment | NS (N =17) | EFLS (N =9) | JR (N = 14) |
| :---: | :---: | :---: | :---: |
| Acceptable | $13.2 \%$ | $36.9 \%$ | $30.1 \%$ |
| Intelligible but not acceptable | $42.6 \%$ | $27.7 \%$ | $42.5 \%$ |
| Not intelligible | $44.1 \%$ | $35.4 \%$ | $27.4 \%$ |

NS = native speakers of English $\quad$ EFLS $=$ English as foreign language speakers
JR = Japanese returnees

The data were not used in terms of EIL in this research, but it shows the tendency of acceptable collocations among the groups. Table 80 above is the percentage of judgment of unclear collocations by the three groups. As Table 80 indicates, native speakers of English accepted only 13.2 \% of the seventy collocations, whereas the collocations which were intelligible but not acceptable were $42.6 \%$. Native-speakers make critical judgments about acceptable collocations. On the contrary, high proficiency EFL learners accepted $36.9 \%$ of the seventy collocations. This percentage was higher than other respondents as they seem to have a more favorable judgment of acceptable collocations. Japanese returnees accepted $30.1 \%$ of the seventy collocations, while the collocations which are intelligible but not acceptable were $42.5 \%$. Although Japanese returnees had many unacceptable collocations, they allowed more acceptable collocations than did the native speakers of English. Thus, EFL learners and Japanese returnees have a wider acceptance of collocations than do native speakers of English.

### 9.4. Future research

The present research on collocations to be learned by Japanese learners of English consists of two data analyses, corpus-based one on the identification of basic collocations and empirical one on the development of their collocational knowledge based on the previous theoretical and practical research of the past 50 years. However, the domain of collocation research has been neglected in Japan in spite of the importance of collocations. This present research clarified an aspect of collocation acquisition by Japanese learners of English but many questions still remained to be solved. Further research should be done in the following fields:

First, research should be conducted on various lexical and grammatical collocations to examine the mechanism of learners' development of whole collocations. This research only focused on verb-noun collocations which play an important role in sentences. However, learners often make errors of not only verb-noun collocations but also other kinds of collocations such as adjective-noun collocations and verb-adverb collocations. Empirical research on other kinds of collocations has to be conducted to gain a comprehensive perspective on collocation acquisition.

Second, future corpus-based research will be needed in order to examine acceptable collocations for both native speakers of English and non-native speakers of English based on the concept of EIL. Collocation research has regarded native English speaker's collocations as the best model to intimate. This is because it is widely accepted that native speakers establish and confirm the rules of the grammar and the usage of language (Crystal, 1992) and therefore their collocations should be used as a model. However, the notion of EIL has spread among us since Smith proposed it in his 1976 seminal paper (cited in Yano, 2004a). EIL is "a loose league of regional standard Englishes with high mutual intelligibility and spoken and understood by the educated speakers of any varieties" (Yano, 2004a, p. 133). In short, EIL is a universally international norm which is intelligible and acceptable among all the English speakers and English language teachers are expected to take it into consideration in their teaching. This EIL concept is supported by the fact that the population of non-native speakers who communicate in English is rapidly growing and non-native speakers have had more opportunities to communicate with each other for specific purposes such as business negotiation (Crystal, 2003). Yano argues that we need to
change our model to teach from native speakers' English model to that of EIL with the view to the present situation of English use in the world that 80 percent of communication in English takes place among non-native speakers. Yano strongly suggests that we change the native speaker-oriented view of Japanese learners of English that only native-speaker English is natural and authentic to more accommodating one.

This concept of EIL is reasonable, but the most critical shortcoming is that it is not supported by data analysis, as is admitted by Yano (2004b). None of proponents have shown concrete examples of EIL which share grammar and basic vocabulary with all English varieties. Therefore, EIL cannot be adopted as a good model to be learned for us and native-speaker collocation model is the best to be used for the collocation analysis at this moment.

In order to identify collocations acceptable for both native speakers and non-native speakers of English based on the concept of EIL and choose from them those collocations appropriate as the EIL model to Japanese learners of English, we need corpus samples collected from various speakers of English - both native and non-native - around the world. For example, ICLE is available to do such research. It is a database collected from samples of 19 English-speaking and ESL countries and each corpus consists of one million spoken and written words. As the project is expanding steadily, English corpora from more various countries will be available in the near future. Collocation analysis based on the concept of EIL is to be done as our project.

## Appendix F．Vocabulary test

語彙テスト Q．日本語の意味を表す英語を（1）～（6）の中から選び，その番号を解答闌に書き入れなさい。

|  | 1．小麦粉を焼いた菓子 |  |  |  |  |  | 2．集まり，会 |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: |
| （1）birthday | （2）cookie | （3）fork | （4）party | （5）star | （6）sweater |  |  |  |  |
|  | 3．玉ねぎ |  | 4．ぶどう |  |  |  |  |  |  |
| （1）grape | （2）lettuce | （3）onion | （4）pear | （5）rose | （6）tree |  |  |  |  |
|  | 5．丸い入れ物 |  | 6．クッションのある長いす |  |  |  |  |  |  |
| （1）bath | （2）lamp | （3）phone | （4）pot | （5）sofa | （6）stove |  |  |  |  |
|  | 7． 40 | 8． 100 |  |  |  |  |  |  |  |
| （1）forty | （2）hundred | （3）month | （4）six | （5）twelve | （6）year |  |  |  |  |

|  | 11．食事 |  | 12．1つ，1 個，一片 |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| （1）air | （2）meal | （3）piece | （4）sign | （5）sound | （6）white |
|  | 13．男の人 |  | 14．象 |  |  |
| （1）change | （2）elephant | （3）man | （4）rabbit | （5）wolf | （6）woman |
|  | 15．顔 |  | 16．てぬぐい |  |  |
| （1）face | （2）finger | （3）hair | （4）leg | （5）shoe | （6）towel |

| （1）cabbage | 1．旗 |  | 2．丸く大きい緑色野菜 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | （2）campus | （3）flag | （4）railway | （5）tin | （6）tournament |
| （1）attention | 3．賞与 |  | 4．盤上で白黒の駒を動かして，勝敗を競うゲーム |  |  |
|  | （2）bonus | （3）chess | （4）hook | （5）pride | （6）union |
| （1）bottom | 5．限界，制限 |  | 6．指導員，指導•助言を与える人 |  |  |
|  | （2）coach | （3）flight | （4）limit | （5）proof | （6）quantity |
| （1）climate | 7．通路，通行 |  | 8．意見，眺め |  |  |
|  | （2）factory | （3）law | （4）link | （5）passage | （6）view |
| （1）district | 9．勝利 |  | 10．力，強さ |  |  |
|  | （2）fault | （3）quarter | （4）storm | （5）strength | （6）victory |
| （1）account | 11．洪水 |  | 12．設備，備品 |  |  |
|  | （2）courage | （3）equipment | （4）factor | （5）flood | （6）lack |
| （1）benefit | 13．しつけ，鍛錬 |  | 14．海岸 |  |  |
|  | （2）coast | （3）discipline | （4）division | （5）soap | （6）truth |
| （1）advise | 15．修理する，修繕する |  | 16．接吻（せっぷん）する，ロづけする |  |  |
|  | （2）establish | （3）kiss | （4）repair | （5）request | （6）settle |
| （1）attract | 17．発見する，見つけ出す |  | 18．救う，救出する |  |  |
|  | （2）discover | （3）observe | （4）pour | （5）recognize | （6）save |
| （1）contain | 19．直す，繕う（つくろう） |  | 20．含む |  |  |
|  | （2）defend | （3）delay | （4）mend | （5）occur | （6）trace |
| （1）appoint | 21．憎む |  | 22．つかみ取る，奪う |  |  |
|  | （2）forgive | （3）hate | （4）pray | （5）seize | （6）spread |
| （1）automatic | 23．余分な |  | 24．自動的な，自動の |  |  |
|  | （2）extra | （3）honest | （4）legal | （5）sharp | （6）smooth |
| （1）awake | 25．費用のかかる，高価な |  | 26．簡単な，単純な |  |  |
|  | （2）exact | （3）expensive | （4）loud | （5）patient | （6）simple |
| （1）curious | 27．好奇心の強い |  | 28．生の，加エしていない |  |  |
|  | （2）equal | （3）independent | （4）raw | （5）social | （6）steady |
|  | 29．分かれた，分離した |  | 30．緊急の，差し迫った |  |  |
| （1）bright | （2）frequent | （3）initial | （4）safe | （5）separate | （6）urgent |

1．顕微鏡
2．望遠鏡

| （1）cube | （2）kilometer | （3）license | （4）microscope | （5）studio | （6）telescope |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3．化学者 |  | 4．消費者 |  |  |
| （1）chemist | （2）consumer | （3）emperor | （4）membership | （5）sergeant | （6）sovereign |
| （1）charity | 5．交響曲 |  | 6．美術館 |  |  |
|  | （2）distribution | （3）faculty | （4）gallery | （5）session | （6）symphony |
|  | 7．認めること，是認 |  | 8．祝宴，宴会 |  |  |

a. looks
b. loves
c. takes

## Appendix I. Questionnaire

## Questionnaire

This is to survey the acceptability and the intelligibility of the English sentences translated from Japanese by the Japanese. For your reference, the model sentences are also given (No. 1 - No. 29).

```
Personal information
Please tick or write in the parenthesis.
Gender: }\square\mathrm{ male }\square\mathrm{ female
    Age:}\begin{array}{lllllll}{\square15-20}&{\square21-25}&{\square26-30}&{\square31-35}&{\square36-40}&{\square40-45}\\{}&{\square46-50}&{\square51-55}&{\square56-60}&{\square61-65}&{\square66-70}&{\square\mathrm{ over 70}}
Your nationality: (
    )
Your native language(s): (
How long have you been in Japan?(
```

Q.

If you think the following sentences are acceptable, please write $\underline{\mathbf{A}}$ in the parenthesis. If you think the following sentences are intelligible but not acceptable, please write $\underline{B}$ in the parenthesis.
If you think the following sentences are not intelligible, please write $\underline{\mathbf{C}}$ in the parenthesis.

1. The school festival will take place next month.
(1). The school festival will open next month. ( )
(2). The school festival will be placed next month. ( )
2. Your advice has no effect on them.
(1). Your advice doesn't give effect on them. ( )
(2). Your advice doesn't make effect on them. ( )
(3). Your advice doesn't take effect on them. ( )
3. Take your time.
(1). Use your time. ( )
(2). Have your time. ( )
(3). Spend your time. ( )
(4). Make your time. ( )
4. I made a big decision.
(1). I did a big decision. ( )
(2). I had a big decision. ( )
(3). I decided a big decision. ( )
(4). I decided a big point. ( )
(5). I decided a big thing. ( )
5. You did a good job!
(1). You had a good job! ( )
(2). You brought about a good job! ( )
(3). You worked a good job! ( )
6. I asked him a question.
(1). I threw him a question. ( )
(2). I gave him a question. ( )
(3). I made him a question. ( )
7. She shook her head.
(1). She turned her head. ( )
(2). She swung her head. ( )
8. I played the role of Hamlet.
(1). I took a role of Hamlet. ( )
9. Make way for the ambulance.
(1). Give way for the ambulance. ( )
(2). Make the way for the ambulance. ( )
(3). Make a way for the ambulance. ( )
(4). Make way to the ambulance. ( )
10. Take no action until I tell you to.
(1). Don't do action until I tell you to. ( )
(2). Make no action until I tell you to. ( )
11. His mail doesn't make sense to me.
(1). His mail doesn't make a sense to me. ( )
(2). His mail doesn't make the sense to me. ( )
(3). His mail doesn't have sense to me. ( )
(4). His mail doesn't take a sense to me. ( )
12. He found his way to our house.
(1). He made his way to our house. ( )
(2). He got the way to our house. ( )
13. We must take steps to prevent such crimes.
(1). We must take step to prevent such crimes. ( )
(2). We must take a step to prevent such crimes. ( )
14. Take care of yourself.
(1). Take care of your body. ( ) (2). Take care of your health. ( )
15. Please answer my question.
(1). Please answer to my question. ( )
16. He makes a great point of being on time.
(1). He has a great point of being on time. ( )
(2). He takes a great point of being on time. ( )
(3). He is a great point of being on time. ( )
17. She took full advantage of her position.
(1). She advantaged her position. ( )
18. I solved a math problem.
(1). I answered a math problem. ( )
(2). I resolved a math problem. ( )
19. My brother got a job as a secretary with the company last year.
(1). My brother had a job as a secretary with the company last year. ( )
20. You made several spelling mistakes in your essay.
(1). You had several spelling mistakes in your essay. ( )
(2). You took several spelling mistakes in your essay. ( )
21. I will make every effort to find him.
(1). I will do every effort to find him. ( )
(2). I will spend every effort to find him. ( )
22. These patients have trouble walking.
(1). These patients are in the trouble walking. ( )
(2). These patients take trouble in walking. ( )
(3). These patients get trouble in walking. ( )
23. He held her hand in his.
(1). He shook her hand in his. ( ) (2). He shook hands in his. ( )
24. He pays no attention to others' feelings.
(1). He has no attention to others' feelings. ( )
(2). He takes no attention to others' feelings. ( )
25. She raised the question of finding his successor.
(1). She took the question of finding his successor. ( )
(2). She had the question of finding his successor. ( )
(3). She gave the question of finding his successor. ( )
26. The meeting was held to discuss the question.
(1). The meeting was open to discuss the question. ( )
(2). The meeting was opened to discuss the question. ( )
(3). The meeting was made to discuss the question. ( )
27. Can you give me an example?
(1). Can you raise an example? (
(2). Can you pick up an example? ( )
28. I cannot give you an answer now.
(1). I cannot tell you an answer now. ( )
29. I played an important role at the meeting.
(1). I performed an important role at the meeting. ( )
(2). I acted an important role at the meeting. ( )
(3). I took an important role at the meeting. ( )

Thank you very much for your cooperation
Taeko KOYA

[^0]:    1 Kennedy's example seems to be wrong: silk collocates with not shade, but raw and rich. The example of distribution given by Gramley and Pätzold (1992) can be applied to grammatically connected.

[^1]:    2 Stubbs (2001, pp. 65-66) preferably uses discourse prosodies instead of semantic prosody, in order to express the relation to speakers and hearers and their function in creating discourse coherence.

[^2]:    ${ }^{3}$ As commit collocates with not only nouns with negative meanings (crime and wrongdoing) but also ones with positive meanings ( money [for example, The council has committed large amounts of money to housing projects.]), this argument of Benson et al.' s is a little bit too strong.

[^3]:    1 According to the user's guide in COLLINS COBUILD English Collocations on CD-ROM (1995, p.17), the Bank of English contains 320 million written and spoken English words which have been collected from a wide range of different sources. Written texts come from newspapers, fiction and non-fiction books, reports, leaflets, brochures, magazines and so on. Spoken texts come from transcriptions of daily conversation, radio broadcasts, meetings, interviews and discussions and so on. These texts consist of British English (about 70\%), American English (about 25\%) and other native varieties of English (about 5\%).

[^4]:    ${ }^{2}$ As a result of the implementation of the new government guidelines for teaching, new English I textbooks were rewritten rather than revising old ones.

    3 COBUILD English Collocations on CD-ROM (1995) and Oxford Collocations Dictionary for Students of English (2002) are corpus-based dictionaries, whose examples are taken from the Bank of English, which show high frequent word combinations used in the daily life of native speakers are not corpus-based. Both types of dictionaries were used to select collocations for this research based on the author's definition of collocation (See 4.2.)

[^5]:    4 The School Councils in the UK is an organization which has been supported by the department for Education and Skills in the UK and accredited as a TA Headlamp Trainer. It also works in partnership with local education authorities. It set up the Schools History Project in 1972 to suggest suitable objectives for history teachers, to promote the use of appropriate materials and teaching methods for their realization, to reconsider the nature of history, and to provide the design of a syllabus framework which shows the uses of history in the education of adolescents.

[^6]:    5 These are incorrect answers which shows direct translation from Japanese and had been made by many Japanese learners of English in English classes.

[^7]:    6 After I conducted this pilot study, I was aware of Mochizuki's test.
    7 This pilot test was based on my MA thesis (1999) completed in the University of Reading. When I was in the UK, I got only the Crown I textbook, which led me to a limited pilot study.

[^8]:    1 The VLT has been generally considered the most reliable vocabulary test, which is supported by Laufer (1992) and Meara (1996).

[^9]:    2 The latest word list, JACET 8000 was published in 2003. This list is a new revised version of the JACET 4000 and is based on the British National Corpus and a set of various sub corpora such as TOEIC corpus and scientific magazine corpus. In corpus-based analysis (Chapters 5 and 6), JACET 8000 was used to select basic nouns for Japanese learners of English, but a vocabulary test based on it has not been developed. Therefore, the VST is the most reliable and useful test to date.

[^10]:    3 Five English-Japanese dictionaries are Eijiro (2000), the Lighthouse English-Japanese Dictionary (2002), the Super Anchor English-Japanese Dictionary (2003), the Lexis English-Japanese Dictionary (2003) and the Genius English-Japanese Dictionary (2001).

[^11]:    4 More than half of the subjects took all level-tests, while some whose vocabulary size was supposed to be very limited took four or five level-tests. However, after their results were calculated, they were shown to have more vocabulary than expected. In that case one more level or two more level tests were given to them.

[^12]:    1 In research question 3, Kruskal Wallis analysis of variance and Mann-Whitney U analysis were used because the smallest number of two or three sub groups was 91 and they were independent.

[^13]:    2 Influential factors for learners' receptive knowledge of collocation are colored gray.
